Index 351
calibre is an e-book library manager. It can view, convert and catalog e-books in most of the major e-book formats. It can also talk to many e-book reader devices. It can go out to the Internet and fetch metadata for your books. It can download newspapers and convert them into e-books for convenient reading. It is cross platform, running on Linux, Windows and macOS.

You've just started calibre. What do you do now? Before calibre can do anything with your e-books, it first has to know about them. Drag and drop a few e-book files into calibre, or click the “Add books” button and browse for the e-books you want to work with. Once you’ve added the books, they will show up in the main view looking something like this:

<table>
<thead>
<tr>
<th>Title</th>
<th>Author</th>
<th>Date</th>
<th>Size</th>
<th>Rating</th>
</tr>
</thead>
<tbody>
<tr>
<td>The Trouble With Physics</td>
<td>Lee Smolin</td>
<td>18 Mar 2011</td>
<td>0.9</td>
<td>★★★★★</td>
</tr>
<tr>
<td>The Wise Man's Fear</td>
<td>Patrick Rothfuss</td>
<td>08 Mar 2011</td>
<td>1.4</td>
<td>★★★★</td>
</tr>
<tr>
<td>The Heroes</td>
<td>Joe Abercrombie</td>
<td>08 Mar 2011</td>
<td>1.2</td>
<td>★★</td>
</tr>
</tbody>
</table>

Once you’ve admired the list of books you just added to your heart’s content, you’ll probably want to read one. In order to do that you’ll have to convert the book to a format your reader understands. When first running calibre, the Welcome wizard starts and will set up calibre for your reader device. Conversion is a breeze. Just select the book you want to convert then click the “Convert books” button. Ignore all the options for now and click “OK”. The little icon in the bottom right corner will start spinning. Once it’s finished spinning, your converted book is ready. Click the “View” button to read the book.

If you want to read the book on your reader, connect it to the computer, wait till calibre detects it (10-20 seconds) and then click the “Send to device” button. Once the icon stops spinning again, disconnect your reader and read away! If you didn’t convert the book in the previous step, calibre will auto convert it to the format your reader device understands.

To get started with more advanced usage, you should read about The Graphical User Interface (page ??). For even more power and versatility, learn the Command Line Interface (page ??). You will find the list of Frequently Asked Questions (page ??) useful as well.

If you have more questions, or want to discuss calibre with other users or ask for help with specific things, there are forums and other help resources available¹.

Sections

¹ https://calibre-ebook.com/help
The Graphical User Interface

The Graphical User Interface (GUI) provides access to all library management and e-book format conversion features. The basic workflow for using calibre is to first add books to the library from your hard disk. calibre will automatically try to read metadata from the books and add them to its internal database. Once they are in the database, you can perform various Actions (page 4) on them that include conversion from one format to another, transfer to the reading device, viewing on your computer, and editing metadata. The latter includes modifying the cover, description, and tags among other details. Note that calibre creates copies of the files you add to it. Your original files are left untouched.

The interface is divided into various sections:

- Actions (page 4)
- Preferences (page 10)
- Catalogs (page 11)
- Search & sort (page 11)
- The search interface (page 12)
- Saving searches (page 14)
- Virtual libraries (page 15)
- Guessing metadata from file names (page 15)
- Book details (page 16)
- Tag browser (page 18)
- Cover grid (page 20)
- Cover browser (page 21)
- Quickview (page 21)
- Jobs (page 22)
- Keyboard shortcuts (page 22)
1.1 Actions

The actions toolbar provides convenient shortcuts to commonly used actions. If you right-click the buttons, you can perform variations on the default action. Please note that the actions toolbar will look slightly different depending on whether you have an e-book reader attached to your computer.

1.1.1 Add books

The Add books action has seven variations accessed by doing a right-click on the button.

1. **Add books from a single directory**: Opens a file chooser dialog and allows you to specify which books in a directory should be added. This action is context sensitive, i.e., it depends on which catalog you have selected. If you have selected the Library, books will be added to the library. If you have selected the e-book reader device, the books will be uploaded to the device, and so on.

2. **Add books from directories, including sub-directories (One book per directory, assumes every e-book file is the same book in a different format)**: Allows you to choose a directory. The directory and all its sub-directories are scanned recursively, and any e-books found are added to the library. calibre assumes that each directory contains a single book. All e-book files in a directory are assumed to be the same book in different formats. This action is the inverse of the Save to disk (page 8) action, i.e., you can Save to disk, delete the books and re-add them with no lost information except for the date (this assumes you have not changed any of the setting for the Save to disk action).

3. **Add books from directories, including sub-directories (Multiple books per directory, assumes every e-book file is a different book)**: Allows you to choose a directory. The directory and all its sub-directories are scanned recursively and any e-books found are added to the library. calibre assumes that each directory contains
many books. All e-book files with the same name in a directory are assumed to be the same book in different formats. E-books with different names are added as different books.

4. **Add multiple books from archive (ZIP/RAR):** Allows you to add multiple e-books that are stored inside the selected ZIP or RAR files. It is a convenient shortcut that avoids having to first unzip the archive and then add the books via one of the above two options.

5. **Add empty book (Book Entry with no formats):** Allows you to create a blank book record. This can be used to then manually fill out the information about a book that you may not have yet in your collection.

6. **Add from ISBN:** Allows you to add one or more books by entering their ISBNs.

7. **Add files to selected book records:** Allows you to add or update the files associated with an existing book in your library.

The **Add books** action can read metadata from a wide variety of e-book formats. In addition, it tries to guess metadata from the filename. See the *Guessing metadata from file names* (page 15) section, to learn how to configure this.

To add an additional format for an existing book you can do any of three things:

1. Drag and drop the file onto the Book details panel on the right side of the main window
2. Right click the **Add books** button and choose **Add files to selected books**.
3. Click the **Add books** button in the top right area of the **Edit Metadata** dialog, accessed by the **Edit metadata** (page 5) action.

### 1.1.2 Edit metadata

The **Edit metadata** action has four variations which can be accessed by doing a right-click on the button.

1. **Edit metadata individually:** Allows you to edit the metadata of books one-by-one with the option of fetching metadata, including covers, from the Internet. It also allows you to add or remove particular e-book formats from a book.

2. **Edit metadata in bulk:** Allows you to edit common metadata fields for large numbers of books simultaneously. It operates on all the books you have selected in the **Library view** (page 11).

3. **Download metadata and covers:** Downloads metadata and covers (if available) for the books that are selected in the book list.

4. **Merge book records:** Gives you the capability of merging the metadata and formats of two or more book records. You can choose to either delete or keep the records that were not clicked first.

For more details see **Editing e-book metadata** (page 125).
1.1.3 Convert books

E-books can be converted from a number of formats into whatever format your e-book reader prefers. Many e-books available for purchase will be protected by Digital Rights Management (DRM) technology. calibre will not convert these e-books. It is easy to remove the DRM from many formats, but as this may be illegal, you will have to find tools to liberate your books yourself and then use calibre to convert them.

For most people, conversion should be a simple one-click affair. If you want to learn more about the conversion process, see E-book conversion (page 61).

The Convert books action has three variations, accessed by doing a right-click on the button.

1. **Convert individually**: Allows you to specify conversion options to customize the conversion of each selected e-book.

2. **Bulk convert**: Allows you to specify options only once to convert a number of e-books in bulk.

3. **Create a catalog of the books in your calibre library**: Allows you to generate a complete listing of the books in your library, including all metadata, in several formats such as XML, CSV, BiBTeX, EPUB and MOBI. The catalog will contain all the books currently showing in the library view. This allows you to use the search features to limit the books to be catalogued. In addition, if you select multiple books using the mouse, only those books will be added to the catalog. If you generate the catalog in an e-book format such as EPUB, MOBI or AZW3, the next time you connect your e-book reader the catalog will be automatically sent to the device. For more information on how catalogs work, read the Creating AZW3 • EPUB • MOBI catalogs (page 221).

1.1.4 View

The View action displays the book in an e-book viewer program. calibre has a built-in viewer for many e-book formats. For other formats it uses the default operating system application. You can configure which formats should open with the internal viewer via Preferences → Interface → Behavior. If a book has more than one format, you can view a particular format by doing a right-click on the button.

1.1.5 Send to device

The Send to device action has eight variations, accessed by doing a right-click on the button.

1. **Send to main memory**: The selected books are transferred to the main memory of the e-book reader.

---

2 https://drmfree.calibre-ebook.com/about#drm
2. **Send to card (A):** The selected books are transferred to the storage card (A) on the e-book reader.

3. **Send to card (B):** The selected books are transferred to the storage card (B) on the e-book reader.

4. **Send specific format to:** The selected books are transferred to the selected storage location on the device, in the format that you specify.

5. **Eject device:** Detaches the device from calibre.

6. **Set default send to device action:** Allows you to specify which of the options, 1 through 5 above or 7 below, will be the default action when you click the main button.

7. **Send and delete from library:** The selected books are transferred to the selected storage location on the device and then deleted from the Library.

8. **Fetch Annotations (experimental):** Transfers annotations you may have made on an e-book on your device to the comments metadata of the book in the calibre library.

You can control the file name and folder structure of files sent to the device by setting up a template in Preferences → Import/export → Sending books to devices. Also see *The calibre template language* (page 161).

### 1.1.6 Fetch news

The *Fetch news* action downloads news from various websites and converts it into an e-book that can be read on your e-book reader. Normally, the newly created e-book is added to your e-book library, but if an e-book reader is connected at the time the download finishes, the news is also uploaded to the reader automatically.

The *Fetch news* action uses simple recipes (10-15 lines of code) for each news site. To learn how to create recipes for your own news sources, see *Adding your favorite news website* (page 25).

The *Fetch news* action has three variations, accessed by doing a right-click on the button.

1. **Schedule news download:** Allows you to schedule the download of your selected news sources from a list of hundreds available. Scheduling can be set individually for each news source you select and the scheduling is flexible allowing you to select specific days of the week or a frequency of days between downloads.

2. **Add a custom news source:** Allows you to create a simple recipe for downloading news from a custom news site that you wish to access. Creating the recipe can be as simple as specifying an RSS news feed URL, or you can be more prescriptive by creating Python-based code for the task. For more information see *Adding your favorite news website* (page 25).

3. **Download all scheduled news sources:** Causes calibre to immediately begin downloading all news sources that you have scheduled.

### 1.1.7 Library

The *Library* action allows you to create, switch between, rename or remove a Library. calibre allows you to create as many libraries as you wish. You could, for instance, create a fiction library, a non-fiction library, a...
foreign language library, a project library, or any structure that suits your needs. Libraries are the highest organizational structure within calibre. Each library has its own set of books, tags, categories and base storage location.

1. **Switch/create library...**: Allows you to; a) connect to a pre-existing calibre library at another location, b) create an empty library at a new location or, c) move the current library to a newly specified location.

2. **Quick switch**: Allows you to switch between libraries that have been registered or created within calibre.

3. **Rename library**: Allows you to rename a Library.

4. **Delete library**: Allows you to unregister a library from calibre.

5. **<library name>**: Actions 5, 6 etc... give you immediate switch access between multiple libraries that you have created or attached to. This list contains only the 5 most frequently used libraries. For the complete list, use the Quick Switch menu.

6. **Library maintenance**: Allows you to check the current library for data consistency issues and restore the current library’s database from backups.

---

**Note**: Metadata about your e-books, e.g. title, author, and tags, is stored in a single file in your calibre library folder called metadata.db. If this file gets corrupted (a very rare event), you can lose the metadata. Fortunately, calibre automatically backs up the metadata for every individual book in the book’s folder as an OPF file. By using the Restore database action under Library Maintenance described above, you can have calibre rebuild the metadata.db file from the individual OPF files for you.

You can copy or move books between different libraries (once you have more than one library setup) by right clicking on the book and selecting the action **Copy to library**.

### 1.1.8 Device

The **Device** action allows you to view the books in the main memory or storage cards of your device, or to eject the device (detach it from calibre). This icon shows up automatically on the main calibre toolbar when you connect a supported device. You can click on it to see the books on your device. You can also drag and drop books from your calibre library onto the icon to transfer them to your device. Conversely, you can drag and drop books from your device onto the library icon on the toolbar to transfer books from your device to the calibre library.

### 1.1.9 Save to disk

The **Save to disk** action has five variations, accessed by doing a right-click on the button.

1. **Save to disk**: Saves the selected books to disk organized in directories. The directory structure looks like:
You can control the file name and folder structure of files saved to disk by setting up a template in Preferences→Import/export→Saving books to disk. Also see The calibre template language (page 161).

2. **Save to disk in a single directory**: Saves the selected books to disk in a single directory.

For 1. and 2., all available formats, as well as metadata, are stored to disk for each selected book. Metadata is stored in an OPF file. Saved books can be re-imported to the library without any loss of information by using the Add books (page 4) action.

3. **Save only *<your preferred>* format to disk**: Saves the selected books to disk in the directory structure as shown in (1.) but only in your preferred e-book format. You can set your preferred format in Preferences→Interface→Behaviour→Preferred output format.

4. **Save only *<your preferred>* format to disk in a single directory**: Saves the selected books to disk in a single directory but only in your preferred e-book format. You can set your preferred format in Preferences→Interface→Behaviour→Preferred output format.

5. **Save single format to disk. . .**: Saves the selected books to disk in the directory structure as shown in (1.) but only in the format you select from the pop-out list.

### 1.1.10 Connect/share

The Connect/share action allows you to manually connect to a device or folder on your computer. It also allows you to set up your calibre library for access via a web browser or email.

The Connect/share action has four variations, accessed by doing a right-click on the button.

1. **Connect to folder**: Allows you to connect to any folder on your computer as though it were a device and use all the facilities calibre has for devices with that folder. Useful if your device cannot be supported by calibre but is available as a USB disk.

2. **Start Content server**: Starts calibre’s built-in web server. When started, your calibre library will be accessible via a web browser from the Internet (if you choose). You can configure how the web server is accessed by setting preferences at Preferences→Sharing→Sharing over the net.

3. **Setup email based sharing of books**: Allows sharing of books and news feeds by email. After setting up email addresses for this option, calibre will send news updates and book updates to the entered email addresses. You can configure how calibre sends email by setting preferences at Preferences→Sharing→Sharing books by email. Once you have set up one or more email addresses, this menu entry will be replaced by menu entries to send books to the configured email addresses.
1.1.11 Remove books

The Remove books action deletes books permanently, so use it with care. It is context sensitive, i.e. it depends on which catalog (page 11) you have selected. If you have selected the Library, books will be removed from the library. If you have selected the e-book reader device, books will be removed from the device. To remove only a particular format for a given book use the Edit metadata (page 5) action. Remove books also has five variations which can be accessed by doing a right-click on the button.

1. **Remove selected books**: Allows you to permanently remove all books that are selected in the book list.

2. **Remove files of a specific format from selected books**: Allows you to permanently remove e-book files of a specified format from books that are selected in the book list.

3. **Remove all formats from selected books, except**: Allows you to permanently remove e-book files of any format except a specified format from books that are selected in the book list.

4. **Remove all formats from selected books**: Allows you to permanently remove all e-book files from books that are selected in the book list. Only the metadata will remain.

5. **Remove covers from selected books**: Allows you to permanently remove cover image files from books that are selected in the book list.

6. **Remove matching books from device**: Allows you to remove e-book files from a connected device that match the books that are selected in the book list.

**Note**: Note that when you use Remove books to delete books from your calibre library, the book record is permanently deleted, but on Windows and macOS the files are placed into the recycle bin. This allows you to recover them if you change your mind.

1.2 Preferences

The Preferences action allows you to change the way various aspects of calibre work. It has four variations, accessed by doing a right-click on the button.

1. **Preferences**: Allows you to change the way various aspects of calibre work. Clicking the button also performs this action.

2. **Run Welcome wizard**: Allows you to start the Welcome wizard which appeared the first time you started calibre.

3. **Get plugins to enhance calibre**: Opens a new window that shows plugins for calibre. These plugins are developed by third parties to extend calibre’s functionality.

4. **Restart in debug mode**: Allows you to enable a debugging mode that can assist the calibre developers in solving problems you encounter with the program. For most users this should remain disabled unless instructed by a developer to enable it.
1.3 Catalogs

A catalog is a collection of books. calibre can manage two types of different catalogs:

1. Library: This is a collection of books stored in your calibre library on your computer.

2. Device: This is a collection of books stored in your e-book reader. It will be available when you connect the reader to your computer.

Many operations, such as adding books, deleting, viewing, etc., are context sensitive. So, for example, if you click the View button when you have the Device catalog selected, calibre will open the files on the device to view. If you have the Library catalog selected, files in your calibre library will be opened instead.

1.4 Search & sort

The Search & Sort section allows you to perform several powerful actions on your book collections.

- You can sort them by title, author, date, rating, etc. by clicking on the column titles. You can also sub-sort, i.e. sort on multiple columns. For example, if you click on the title column and then the author column, the book will be sorted by author and then all the entries for the same author will be sorted by title.

- You can search for a particular book or set of books using the Search bar. More on that below.

- You can quickly and conveniently edit metadata by selecting the entry you want changed in the list and pressing the E key.

- You can perform Actions (page 4) on sets of books. To select multiple books you can either:
  - Keep the Ctrl key pressed and click on the books you want selected.
– Keep the Shift key pressed and click on the starting and ending book of a range of books you want selected.

• You can configure which fields you want displayed by using the Preferences (page 10) dialog.

1.5 The search interface

You can search all the metadata by entering search terms in the Search bar. Searches are case insensitive. For example:

```
Asimov Foundation format:lrf
```

This will match all books in your library that have Asimov and Foundation in their metadata and are available in the LRF format. Some more examples:

```
author:Asimov and not series:Foundation
title:"The Ring" or "This book is about a ring"
format:epub publisher:feedbooks.com
```

Searches are by default ‘contains’. An item matches if the search string appears anywhere in the indicated metadata. Two other kinds of searches are available: equality search and search using regular expressions\(^3\).

Equality searches are indicated by prefixing the search string with an equals sign (=). For example, the query `tag:="science"` will match “science”, but not “science fiction” or “hard science”. Regular expression searches are indicated by prefixing the search string with a tilde (~). Any Python-compatible regular expression\(^4\) can be used. Note that backslashes used to escape special characters in regular expressions must be doubled because single backslashes will be removed during query parsing. For example, to match a literal parenthesis you must enter `\(`. Regular expression searches are ‘contains’ queries unless the expression contains anchors.

Should you need to search for a string with a leading equals or tilde, prefix the string with a backslash.

Enclose search strings with quotes (") if the string contains parenthesis or spaces. For example, to search for the tag Science Fiction you would need to search for `tag:="science fiction"`. If you search for `tag:=science fiction` you will find all books with the tag ‘science’ and containing the word ‘fiction’ in any metadata.

You can build advanced search queries easily using the Advanced search dialog accessed by clicking the button \(^\text{12 Chapter 1. The Graphical User Interface}\). You can build advanced search queries easily using the Advanced search dialog accessed by clicking the button.

Available fields for searching are: tag, title, author, publisher, series, series_index, rating, cover, comments, format, identifiers, date, pubdate, search, size, vl and custom columns. If a device is plugged in, the ondevice field becomes available, when searching the calibre library view. To find the search name (actually called the lookup name) for a custom column, hover your mouse over the column header in the library view.

The syntax for searching for dates is:

```
pubdate:>2000-1 Will find all books published after Jan, 2000
date:<=2000-1-3 Will find all books added to calibre before 3 Jan, 2000
pubdate:=2009 Will find all books published in 2009
```

If the date is ambiguous, the current locale is used for date comparison. For example, in an mm/dd/yyyy locale 2/1/2009 is interpreted as 1 Feb 2009. In a dd/mm/yyyy locale it is interpreted as 2 Jan 2009. Some special date strings are available. The string today translates to today’s date, whatever it is. The strings yesterday and

\(^{3}\) https://en.wikipedia.org/wiki/Regular_expression

\(^{4}\) https://docs.python.org/2/library/re.html
thismonth (or the translated equivalent in the current language) also work. In addition, the string daysago (also translated) can be used to compare to a date some number of days ago. For example:

```
date:>10daysago
date:<=45daysago
```

To avoid potential problems with translated strings when using a non-English version of calibre, the strings _today, _yesterday, _thismonth, and _daysago are always available. They are not translated.

You can search for books that have a format of a certain size like this:

```
size:>1.1M Will find books with a format larger than 1.1MB
size:<=1K Will find books with a format smaller than 1KB
```

Dates and numeric fields support the relational operators = (equals), > (greater than), >= (greater than or equal to), < (less than), <= (less than or equal to), and != (not equal to). Rating fields are considered to be numeric. For example, the search rating:>=3 will find all books rated 3 or higher.

You can search for the number of items in multiple-valued fields such as tags. These searches begin with the character #, then use the same syntax as numeric fields. For example, to find all books with more than 4 tags use tags:#>4. To find all books with exactly 10 tags use tags:#=10.

Series indices are searchable. For the standard series, the search name is ‘series_index’. For custom series columns, use the column search name followed by _index. For example, to search the indices for a custom series column named #my_series, you would use the search name #my_series_index. Series indices are numbers, so you can use the relational operators described above.

The special field search is used for saved searches. So if you save a search with the name “My spouse’s books” you can enter search:”My spouse's books" in the Search bar to reuse the saved search. More about saving searches below.

The special field vl is used to search for books in a virtual library. For example, vl:Read will find all the books in the Read virtual library. The search vl:Read and vl:"Science Fiction" will find all the books that are in both the Read and Science Fiction virtual libraries. The value following vl: must be the name of a virtual library. If the virtual library name contains spaces then surround it with quotes.

You can search for the absence or presence of a field using the special “true” and “false” values. For example:

```
cover:false will give you all books without a cover
series:true will give you all books that belong to a series
comments:false will give you all books with an empty comment
format:false will give you all books with no actual files (empty records)
```

Yes/no custom columns are searchable. Searching for false, empty, or blank will find all books with undefined values in the column. Searching for true will find all books that do not have undefined values in the column. Searching for yes or checked will find all books with Yes in the column. Searching for no or unchecked will find all books with No in the column. Note that the words yes, no, blank, empty, checked and unchecked are translated; you can use either the current language’s equivalent word or the English word. The words true and false and the special values _yes, _no, and _empty are not translated.

Hierarchical items (e.g. A.B.C) use an extended syntax to match initial parts of the hierarchy. This is done by adding a period between the exact match indicator (=) and the text. For example, the query tags:=.A will find the tags A and A.B, but will not find the tags AA or AA.B. The query tags:=.A.B will find the tags A.B and A.B.C, but not the tag A.

Identifiers (e.g., isbn, doi, lccn etc) also use an extended syntax. First, note that an identifier has the form typetype:valuere, as in isbn:123456789. The extended syntax permits you to specify independently which type and value to search for. Both the type and the value parts of the query can use equality, contains, or regular expression matches. Examples:

1.5. The search interface
• **identifiers:true** will find books with any identifier.
• **identifiers:false** will find books with no identifier.
• **identifiers:123** will search for books with any type having a value containing 123.
• **identifiers:=123456789** will search for books with any type having a value equal to 123456789.
• **identifiers:=isbn: and identifiers:isbn:true** will find books with a type equal to isbn having any value.
• **identifiers:=isbn:false** will find books with no type equal to isbn.
• **identifiers:=isbn:123** will find books with a type equal to isbn having a value containing 123.
• **identifiers:=isbn:=123456789** will find books with a type equal to isbn having a value equal to 123456789.
• **identifiers:i:1** will find books with a type containing an i having a value containing a 1.

![Advanced Search dialog](image)

Fig. 1: *Advanced search dialog*

### 1.6 Saving searches

calibre allows you to save a frequently used search under a special name and then reuse that search with a single click. To do this, create your search either by typing it in the Search bar or using the Tag browser. Then type the name you would like to give to the search in the Saved Searches box next to the Search bar. Click the plus icon next to the saved searches box to save the search.
Now you can access your saved search in the Tag browser under “Searches”. A single click will allow you to reuse any arbitrarily complex search easily, without needing to re-create it.

1.7 Virtual libraries

A Virtual library is a way to pretend that your calibre library has only a few books instead of its full collection. This is an excellent way to partition your large collection of books into smaller, manageable chunks. To learn how to create and use virtual libraries, see the tutorial: Virtual libraries (page 225).

1.8 Guessing metadata from file names

Normally, calibre reads metadata from inside the book file. However, it can be configured to read metadata from the file name instead, via Preferences → Import/export → Adding books → Read metadata from file contents.

You can also control how metadata is read from the filename using regular expressions (see All about using regular expressions in calibre (page ??)). In the Adding Books section of the configuration dialog, you can specify a regular expression that calibre will use to try and guess metadata from the names of e-book files that you add to the library. The default regular expression is:

```
title - author
```

that is, it assumes that all characters up to the first – are the title of the book and subsequent characters are the author of the book. For example, the filename:

```
Foundation and Earth - Isaac Asimov.txt
```

will be interpreted to have the title: Foundation and Earth and author: Isaac Asimov

**Tip:** If the filename does not contain the hyphen, the above regular expression will fail.
1.9 Book details

The Book details display shows the cover and all the metadata for the currently selected book. It can be hidden via
the *Layout* button in the lower right corner of the main calibre window. The author names shown in the Book details panel are click-able, they will by default take you to the Wikipedia page for the author. This can be customized by right clicking on the author name and selecting Manage this author.

Similarly, if you download metadata for the book, the Book details panel will automatically show you links pointing to the web pages for the book on amazon, worldcat, etc. from where the metadata was downloaded.

You can right click on individual e-book formats in the Book details panel to delete them, compare them to their original versions, save them to disk, open them with an external program, etc.

You can change the cover of the book by simply drag and dropping an image onto the Book details panel. If you wish to edit the cover image in an external program, simply right click on it and choose *Open with*.

You can also add e-book files to the current book by drag and dropping the files onto the Book details panel.

Double clicking the Book details panel will open it up in a separate popup window.

Finally, you can customize exactly what information is displayed in the Book details panel via *Preferences→Interface→Look & feel→Book details*. 

1.9. Book details
1.10 Tag browser

The Tag browser allows you to easily browse your collection by Author/Tags/Series/etc. If you click on any item in the Tag browser, for example the author name Isaac Asimov, then the list of books to the right is restricted to showing books by that author. You can click on category names as well. For example, clicking on “Series” will show you all books in any series.

The first click on an item will restrict the list of books to those that contain or match the item. Continuing the above example, clicking on Isaac Asimov will show books by that author. Clicking again on the item will change what is shown, depending on whether the item has children (see sub-categories and hierarchical items below). Continuing the Isaac Asimov example, clicking again on Isaac Asimov will restrict the list of books to those not by Isaac Asimov. A third click will remove the restriction, showing all books. If you hold down the Ctrl or Shift keys and click on multiple items, then restrictions based on multiple items are created. For example you could hold Ctrl and click on the tags History and Europe for finding books on European history. The Tag browser works by constructing search expressions that are automatically entered into the Search bar. Looking at what the Tag browser generates is a good way to learn how to construct basic search expressions.

Items in the Tag browser have their icons partially colored. The amount of color depends on the average rating of the
books in that category. So for example if the books by Isaac Asimov have an average of four stars, the icon for Isaac Asimov in the Tag browser will be 4/5th colored. You can hover your mouse over the icon to see the average rating.

The outer-level items in the Tag browser, such as Authors and Series, are called categories. You can create your own categories, called User categories, which are useful for organizing items. For example, you can use the User categories editor (click the Configure button at the lower-left of the Tag browser and choose Manage authors, series, etc→User categories) to create a User category called Favorite Authors, then put the items for your favorites into the category. User categories can have sub-categories. For example, the User category Favorites.Authors is a sub-category of Favorites. You might also have Favorites.Series, in which case there will be two sub-categories under Favorites. Sub-categories can be created by right-clicking on a User category, choosing Add sub-category to..., and entering the sub-category name; or by using the User categories editor by entering names like the Favorites example above.

You can search User categories in the same way as built-in categories, by clicking on them. There are four different searches cycled through by clicking:

1. “everything matching an item in the category” indicated by a single green plus sign.
2. “everything matching an item in the category or its sub-categories” indicated by two green plus signs.
3. “everything not matching an item in the category” shown by a single red minus sign.
4. “everything not matching an item in the category or its sub-categories” shown by two red minus signs.

It is also possible to create hierarchies inside some of the text categories such as tags, series, and custom columns. These hierarchies show with the small triangle, permitting the sub-items to be hidden. To use hierarchies of items in a category, you must first go to Preferences→Interface→Look & feel and enter the category name(s) into the “Categories with hierarchical items” box. Once this is done, items in that category that contain periods will be shown using the small triangle. For example, assume you create a custom column called “Genre” and indicate that it contains hierarchical items. Once done, items such as Mystery.Thriller and Mystery.English will display as Mystery with the small triangle next to it. Clicking on the triangle will show Thriller and English as sub-items. See Managing subgroups of books, for example “genre” (page 153) for more information.

Hierarchical items (items with children) use the same four ‘click-on’ searches as User categories. Items that do not have children use two of the searches: “everything matching” and “everything not matching”.

You can drag and drop items in the Tag browser onto User categories to add them to that category. If the source is a User category, holding the shift key while dragging will move the item to the new category. You can also drag and drop books from the book list onto items in the Tag browser; dropping a book on an item causes that item to be automatically applied to the dropped books. For example, dragging a book onto Isaac Asimov will set the author of that book to Isaac Asimov. Dropping it onto the tag History will add the tag History to the book’s tags.

You can easily find any item in the Tag browser by clicking the search button at the lower-right corner. In addition, you can right click on any item and choose one of several operations. Some examples are to hide it, rename it, or open a “Manage x” dialog that allows you to manage items of that kind. For example, the “Manage Authors” dialog allows you to rename authors and control how their names are sorted.

You can control how items are sorted in the Tag browser via the Configure button at the lower-left of the Tag browser. You can choose to sort by name, average rating or popularity (popularity is the number of books with an item in your library; for example, the popularity of Isaac Asimov is the number of books in your library by Isaac Asimov).
1.11 Cover grid

You can have calibre display a grid of book covers instead of a list of books, if you prefer to browse your collection by covers instead. The Cover grid is activated by clicking the Layout button in the bottom right corner of the main calibre window. You can customize the cover sizes and the background of the Cover grid via Preferences → Interface → Look & feel → Cover grid. You can even have calibre display any specified field under the covers, such as title or authors or rating or a custom column of your own devising.
1.12 Cover browser

In addition to the Cover grid described above, you can also have calibre display covers in the single row. This is activated via the Layout button in the lower right corner of the main window. In Preferences→Interface→Look & feel→Cover browser you can change the number of covers displayed, and even have the Cover browser display itself in a separate popup window.

1.13 Quickview

Sometimes you want to select a book and quickly get a list of books with the same value in some category (authors, tags, publisher, series, etc.) as the currently selected book, but without changing the current view of the library. You can do this with Quickview. Quickview opens either a second window or a panel in the book list showing the list of books matching the value of interest. For example, assume you want to see a list of all the books with the one or more of the authors of the currently-selected book. Click in the author cell you are interested in and press the ‘Q’ key or click the Quickview icon in the Layout section of the calibre window. A window or panel will open with all the authors for that book on the left, and all the books by the selected author on the right.

Some example Quickview usages: quickly seeing what other books:

- have some tag(s) applied to the currently selected book,
- are in the same series as the current book
- have the same values in a custom column as the current book
- are written by one of the same authors of the current book
- share values in a custom column

There are two choices for where the Quickview information appears:

1. It can open “undocked”: on top of the calibre window and will stay open until you explicitly close it.
2. It can open “docked”: as a panel in the book list section of the calibre main window.

You can move the window from docked to undocked as desired using the “Dock/Undock” button.
The Quickview panel can be left open permanently, in which case it follows movements on the book list. For example, if you click in the calibre library view on a category column (tags, series, publisher, authors, etc.) for a book, the Quickview window contents will change to show you in the left-hand side panel the values in that category for the selected book (e.g., the tags for that book). The first item in that list will be selected, and Quickview will show you on the right-hand side panel all the books in your library that use that value. Click on an different value in the left-hand panel to see the books with that different value.

Double-click on a book in the Quickview window to select that book in the library view. This will also change the items display in the QuickView window (the left-hand panel) to show the items in the newly-selected book.

Shift- or Ctrl- double-click on a book in the Quickview window to open the edit metadata dialog on that book in the calibre window. The edited book will be Quickview ed when you close the edit metadata dialog.

You can see if a column can be Quickview ed by hovering your mouse over the column heading and looking at the tooltip for that heading. You can also know by right-clicking on the column heading to see of the “Quickview” option is shown in the menu, in which case choosing that Quickview option is equivalent to pressing ‘Q’ in the current cell.

Options (in Preferences→Look & feel→Quickview):

- Respect (or not) the current virtual library. If checked then Quickview shows only books in the current virtual library. Default: respect virtual libraries
- Change the Quickview window contents when the column is changed on the book list using the cursor keys. Default: don’t follow changes made with cursor keys
- Change the column being “quickview’ed” when a cell in the Quickview window is double-clicked. Otherwise the book is changed but the column being examined is not. Default: change the column
- Change the column being “quickview’ed” to the current column when the return key is pressed in the Quickview panel. Otherwise the book is changed but the column being examined is not. Default: change the column
- Choose which columns are shown in the Quickview window/panel.

1.14 Jobs

The Jobs panel shows the number of currently running jobs. Jobs are tasks that run in a separate process. They include converting e-books and talking to your reader device. You can click on the jobs panel to access the list of jobs. Once a job has completed you can see a detailed log from that job by double-clicking it in the list. This is useful to debug jobs that may not have completed successfully.

1.15 Keyboard shortcuts

calibre has several keyboard shortcuts to save you time and mouse movement. These shortcuts are active in the book list view (when you're not editing the details of a particular book), and most of them affect the title you have selected. The calibre E-book viewer has its own shortcuts which can be customised by clicking the Preferences button in the viewer.

Note:  Note: The calibre keyboard shortcuts do not require a modifier key (Command, Option, Control, etc.), unless specifically noted. You only need to press the letter key, e.g. E to edit.

</table>
calibre has a powerful, flexible and easy-to-use framework for downloading news from the Internet and converting it into an e-book. The following will show you, by means of examples, how to get news from various websites.

To gain an understanding of how to use the framework, follow the examples in the order listed below:

- **Completely automatic fetching** (page 25)
  - The calibre blog (page 26)
  - bbc.co.uk (page 27)
- **Customizing the fetch process** (page 27)
  - Using the print version of bbc.co.uk (page 27)
  - Replacing article styles (page 28)
  - Slicing and dicing (page 29)
  - Real life example (page 43)
- **Tips for developing new recipes** (page 46)
- **Further reading** (page 46)
- **API documentation** (page 47)

## 2.1 Completely automatic fetching

If your news source is simple enough, calibre may well be able to fetch it completely automatically, all you need to do is provide the URL. Calibre gathers all the information needed to download a news source into a *recipe*. In order to tell calibre about a news source, you have to create a *recipe* for it. Let’s see some examples:
2.1.1 The calibre blog

The calibre blog is a blog of posts that describe many useful calibre features in a simple and accessible way for new calibre users. In order to download this blog into an e-book, we rely on the **RSS** feed of the blog:

http://blog.calibre-ebook.com/feeds/posts/default

I got the RSS URL by looking under “Subscribe to” at the bottom of the blog page and choosing **Posts → Atom**. To make calibre download the feeds and convert them into an e-book, you should right click the **Fetch news** button and then the **Add a custom news source** menu item and then the **New Recipe** button. A dialog similar to that shown below should open up.

First enter **calibre Blog** into the **Recipe title** field. This will be the title of the e-book that will be created from the articles in the above feeds.

The next two fields (**Oldest article** and **Max. number of articles per feed**) allow you some control over how many articles should be downloaded from each feed, and they are pretty self explanatory.

To add the feeds to the recipe, enter the feed title and the feed URL and click the **Add feed** button. Once you have added the feed, simply click the **Save** button and you’re done! Close the dialog.
To test your new recipe, click the Fetch news button and in the Custom news sources sub-menu click calibre Blog. After a couple of minutes, the newly downloaded e-book of blog posts will appear in the main library view (if you have your reader connected, it will be put onto the reader instead of into the library). Select it and hit the View button to read!

The reason this worked so well, with so little effort is that the blog provides full-content RSS feeds, i.e., the article content is embedded in the feed itself. For most news sources that provide news in this fashion, with full-content feeds, you don’t need any more effort to convert them to e-books. Now we will look at a news source that does not provide full content feeds. In such feeds, the full article is a webpage and the feed only contains a link to the webpage with a short summary of the article.

### 2.1.2 bbc.co.uk

Lets try the following two feeds from The BBC:

Follow the procedure outlined in The calibre blog (page 26) above to create a recipe for The BBC (using the feeds above). Looking at the downloaded e-book, we see that calibre has done a creditable job of extracting only the content you care about from each article’s webpage. However, the extraction process is not perfect. Sometimes it leaves in undesirable content like menus and navigation aids or it removes content that should have been left alone, like article headings. In order, to have perfect content extraction, we will need to customize the fetch process, as described in the next section.

### 2.2 Customizing the fetch process

When you want to perfect the download process, or download content from a particularly complex website, you can avail yourself of all the power and flexibility of the recipe framework. In order to do that, in the Add custom news sources dialog, simply click the Switch to Advanced mode button.

The easiest and often most productive customization is to use the print version of the online articles. The print version typically has much less cruft and translates much more smoothly to an e-book. Let’s try to use the print version of the articles from The BBC.

#### 2.2.1 Using the print version of bbc.co.uk

The first step is to look at the e-book we downloaded previously from bbc.co.uk (page 27). At the end of each article, in the e-book is a little blurb telling you where the article was downloaded from. Copy and paste that URL into a browser. Now on the article webpage look for a link that points to the “Printable version”. Click it to see the print version of the article. It looks much neater! Now compare the two URLs. For me they were:

**Article URL**  https://news.bbc.co.uk/2/hi/science/nature/7312016.stm

**Print version URL**  https://newsvote.bbc.co.uk/mpapps/pagetools/print/news.bbc.co.uk/2/hi/science/nature/7312016.stm

So it looks like to get the print version, we need to prefix every article URL with:

newsvote.bbc.co.uk/mpapps/pagetools/print/

Now in the Advanced Mode of the Custom news sources dialog, you should see something like (remember to select The BBC recipe before switching to advanced mode):
You can see that the fields from the Basic mode have been translated to Python code in a straightforward manner. We need to add instructions to this recipe to use the print version of the articles. All that’s needed is to add the following two lines:

```python
def print_version(self, url):
    return url.replace('https://', 'https://newsvote.bbc.co.uk/mpapps/pagetools/print/
˓
˓
˓
˓→')
```

This is Python, so indentation is important. After you’ve added the lines, it should look like:

```python
def print_version(self, url):
    return url.replace('https://', 'https://newsvote.bbc.co.uk/mpapps/pagetools/print/
˓
˓
˓
˓→')
```

In the above, `def print_version(self, url)` defines a method that is called by calibre for every article. `url` is the URL of the original article. What `print_version` does is take that url and replace it with the new URL that points to the print version of the article. To learn about Python see the tutorial.

Now, click the Add/update recipe button and your changes will be saved. Re-download the e-book. You should have a much improved e-book. One of the problems with the new version is that the fonts on the print version webpage are too small. This is automatically fixed when converting to an e-book, but even after the fixing process, the font size of the menus and navigation bar to become too large relative to the article text. To fix this, we will do some more customization, in the next section.

### 2.2.2 Replacing article styles

In the previous section, we saw that the font size for articles from the print version of The BBC was too small. In most websites, The BBC included, this font size is set by means of CSS stylesheets. We can disable the fetching of such stylesheets by adding the line:

```python
5 https://www.python.org
6 https://docs.python.org/2/tutorial/
```
The recipe now looks like:

```python
class AdvancedUserRecipe1206419520(BasicNewsRecipe):
    title = u'The BBC'
    oldest_article = 7
    max_articles_per_feed = 100
    no_stylesheets = True

    feeds = [(u'News Front Page', u'http://newsrss.bbc.co.uk/rss/newsonline'),
             (u'Latest News', u'http://newsvote.bbc.co.uk/mpapps/pagetools/'),
             (u'BBC Sport', u'http://rss.sport.bbc.co.uk/rss/New/Sport'))

    def print_version(self, url):
        return url.replace('http://', 'http://newsvote.bbc.co.uk/mpapps/pagetools/')
```

The new version looks pretty good. If you’re a perfectionist, you’ll want to read the next section, which deals with actually modifying the downloaded content.

### 2.2.3 Slicing and dicing

calibre contains very powerful and flexible abilities when it comes to manipulating downloaded content. To show off a couple of these, let’s look at our old friend the *The BBC* (page 29) recipe again. Looking at the source code (*HTML*) of a couple of articles (print version), we see that they have a footer that contains no useful information, contained in

```html
<div class="footer">
...
</div>
```

This can be removed by adding:

```python
remove_tags = [dict(name='div', attrs={'class':'footer'})]
```

to the recipe. Finally, let’s replace some of the *CSS* that we disabled earlier, with our own *CSS* that is suitable for conversion to an e-book:

```python
extra_css = '.headline {font-size: x-large;}
 .fact { padding-top: 10pt ;}'
```

With these additions, our recipe has become “production quality”, indeed it is very close to the actual recipe used by calibre for the *BBC*, shown below:

```

# Import the regular expressions module.
import re

# Import the BasicNewsRecipe class which this class extends.
from calibre.web.feeds.recipes import BasicNewsRecipe

def classes(classes):
    q = frozenset(classes.split(' '))
    return dict(attrs={
        'class': lambda x: x and frozenset(x.split()).intersection(q)
    })

class BBCNews(BasicNewsRecipe):

    # **** IMPORTANT USERS READ ME ****
    # First select the feeds you want then scroll down below the feeds list
    # and select the values you want for the other user preferences, like
    # oldest_article and such like.
    #
    # Select the BBC rss feeds which you want in your ebook.
    # Selected feed have NO '#' at their start, de-selected feeds begin with a '#'.
    # Eg. ("News Home", "http://feeds.bbci.co.uk/... - include feed.
    # Eg. #("News Home", "http://feeds.bbci.co.uk/... - do not include feed.
    # There are 68 feeds below which constitute the bulk of the available rss
    # feeds on the BBC web site. These include 5 blogs by editors and
    # correspondents, 16 sports feeds, 15 'sub' regional feeds (Eg. North West
    # Wales, Scotland Business), and 7 Welsh language feeds.
    # Some of the feeds are low volume (Eg. blogs), or very low volume (Eg. Click)
    # so if "oldest_article = 1.5" (only articles published in the last 36 hours)
    # you may get some 'empty feeds' which will not then be included in the ebook.
    # The 15 feeds currently selected below are simply my default ones.
    # Note: With all 68 feeds selected, oldest_article set to 2,
    # max_articles_per_feed set to 100, and simultaneous_downloads set to 10,
    # the ebook creation took 29 minutes on my speedy 100 mbps net connection,
    # fairly high-end desktop PC running Linux (Ubuntu Lucid-Lynx).
    # More realistically with 15 feeds selected, oldest_article set to 1.5,
    # max_articles_per_feed set to 100, and simultaneous_downloads set to 20,
    # it took 6 minutes. If that's too slow increase 'simultaneous_downloads'.
    # Select / de-select the feeds you want in your ebook.
# feeds = [
    "News Home", "http://feeds.bbci.co.uk/news/rss.xml"),

# Title to use for the ebook.

# **** SELECT YOUR USER PREFERENCES ****

(continues on next page)
title = 'BBC News'

# A brief description for the ebook.
# description = u'BBC web site ebook created using rss feeds.'

# The max number of articles which may be downloaded from each feed.
# I've never seen more than about 70 articles in a single feed in the
# BBC feeds.
# max_articles_per_feed = 100

# The max age of articles which may be downloaded from each feed. This is
# specified in days - note fractions of days are allowed, Eg. 2.5 (2 and a
# half days). My default of 1.5 days is the last 36 hours, the point at
# which I've decided 'news' becomes 'old news', but be warned this is not
# so good for the blogs, technology, magazine, etc., and sports feeds.
# You may wish to extend this to 2-5 but watch out ebook creation time will
# increase as well. Setting this to 30 will get everything (AFAICT) as long
# as max_articles_per_feed remains set high (except for 'Click' which is
# v. low volume and its currently oldest article is 4th Feb 2011).
# oldest_article = 1.5

# Number of simultaneous downloads. 20 is consistantly working fine on the
# BBC News feeds with no problems. Speeds things up from the default of 5.
# If you have a lot of feeds and/or have increased oldest_article above 2
# then you may wish to try increasing simultaneous_downloads to 25-30,
# Or, of course, if you are in a hurry. [I've not tried beyond 20.]
# simultaneous_downloads = 20

# Timeout for fetching files from the server in seconds. The default of
# 120 seconds, seems somewhat excessive.
# timeout = 30

# The format string for the date shown on the ebook's first page.
# List of all values: http://docs.python.org/library/time.html
# Default in news.py has a leading space so that's mirrored here.
# As with 'feeds' select/de-select by adding/removing the initial '#',
# only one timefmt should be selected, here's a few to choose from.
#
# [Fri, 14 Nov 2011] (Calibre default)
# timefmt = ' [%a, %d %b %Y]
# timefmt = ' [%a, %d %b %Y %H:%M]'
# timefmt = ' [%Y-%m-%d %H:%M]
# timefmt = ' [%Y-%m-%d-%H-%M]'  # [2011-11-14-18-30]

# **** IMPORTANT ****
# DO NOT EDIT BELOW HERE UNLESS YOU KNOW WHAT YOU ARE DOING.
Author of this recipe.
__author__ = 'mattst'

Specify English as the language of the RSS feeds (ISO-639 code).
language = 'en_GB'

Set tags.
tags = 'news, sport, blog'

Set publisher and publication type.
publisher = 'BBC'
publication_type = 'newspaper'

Disable stylesheets from site.
negative_stylesheets = True

Specifies an override encoding for sites that have an incorrect charset
specified. Default of 'None' says to auto-detect. Some other BBC recipes
use 'utf8', which works fine (so use that if necessary) but auto-detecting
with None is working fine, so stick with that for robustness.
encoding = None

Sets whether a feed has full articles embedded in it. The BBC feeds do
not.
use_embedded_content = False

Removes empty feeds - why keep them!? 
remove_empty_feeds = True
ignore_duplicate_articles = {'title', 'url'}
resolve_internal_links = True

Create a custom title which fits nicely in the Kindle title list.
Requires "import time" above class declaration, and replacing
title with custom_title in conversion_options (right column only).
Example of string below: "BBC News - 14 Nov 2011"

custom_title = "BBC News - " + time.strftime('%d %b %Y')

Conversion options for advanced users. Avoid setting 'linearize_tables'
as that plays havoc with the 'old style' table based pages.
conversion_options = {
    # 'title' : title,
    # 'comments' : description,
    # 'tags' : tags,
    # 'language' : language,
    # 'publisher' : publisher,
    # 'authors' : publisher,
    'smarten_punctuation' : True
}
# Specify extra CSS - overrides ALL other CSS (IE. Added last).
extra_css = 'body { font-family: verdana, helvetica, sans-serif; }
   .introduction, .first { font-weight: bold; }
   .cross-head { font-weight: bold; font-size: 125%; }
   .cap, .caption { display: block; font-size: 80%; font-style: italic; }
   .cap, .caption, .caption img, .caption span { display: block; text-align: center; margin: 5px auto; }
   .byl, .byd, .byline img, .byline-name, .byline-title, .author-name, .author-position, .correspondent-portrait img, .byline-lead-in, .name, .bbc-role {
      display: block; text-align: center; font-size: 80%; font-style: italic; margin: 1px auto; }
   story-date, .published { font-size: 80%; }
   table { width: 100%; }
   td img { display: block; margin: 5px auto; }
   ul { padding-top: 10px; }
   ol { padding-top: 10px; }
   li { padding-top: 5px; padding-bottom: 5px; }
   h1 { text-align: center; font-size: 175%; font-weight: bold; }
   h2 { text-align: center; font-size: 150%; font-weight: bold; }
   h3 { text-align: center; font-size: 125%; font-weight: bold; }
   h4, h5, h6 { text-align: center; font-size: 100%; font-weight: bold; }

# Remove various tag attributes to improve the look of the ebook pages.
remove_attributes = ['border', 'cellspacing', 'align', 'cellpadding', 'colspan', 'valign', 'vspace', 'hspace', 'alt', 'width', 'height']

# Remove the (admittedly rarely used) line breaks, "<br />", which sometimes # cause a section of the ebook to start in an unsightly fashion or, more # frequently, a "<br />" will muck up the formatting of a correspondent's byline. # "<br />" and "<br clear/>" are far more frequently used on the table formatted # style of pages, and really spoil the look of the ebook pages.
preprocess_regexps = [(re.compile(r'<br[ ]*clear.*/>', re.IGNORECASE), lambda m: ''),
   (re.compile(r'<br[ ]*/>', re.IGNORECASE), lambda m: '')]

# Create regular expressions for tag keeping and removal to make the matches more # robust against minor changes and errors in the HTML, Eg. double spaces, leading # and trailing spaces, missing hyphens, and such like.
# Python regular expression ('re' class) page:
# http://docs.python.org/library/re.html

# *******************************************************
# Regular expressions for keep_only_tags:
# *******************************************************

# The BBC News HTML pages use variants of 'storybody' to denote the section of a # HTML # page which contains the main text of the article. Match storybody variants:
'\s*storybody',
   # 'story-body', 'story body', 'storybody ', etc.
storybody_reg_exp = '\.\s*storybody.*body.*$'

# The BBC sport and 'newsbeat' (features) HTML pages use 'blq_content' to hold the title
(calculated on next page)
# and published date. This is one level above the usual news pages which have the
# and date within 'story-body'. This is annoying since 'blq_content' must also be
# kept, resulting in a lot of extra things to be removed by remove_tags.
blq_content_reg_exp = '^.*blq[_ -]*content.*$'

# The BBC has an alternative page design structure, which I suspect is an out-of-
# date design but which is still used in some articles, Eg. 'Click' (technology),
# 'FastTrack', (travel), and in some sport pages. These alternative pages are table based,
# (which is why I think they are an out-of-date design) and account for -I'm guesstimaking-
# less than 1% of all articles. They use a table class 'storycontent' to hold the
# article, and like blq_content (above) have required lots of extra removal by
# remove_tags.
story_content_reg_exp = '^.*story[_ -]*content.*$'

# Keep the sections of the HTML which match the list below. The HTML page created
# by Calibre will fill <body> with those sections which are matched. Note that the
# blq_content_reg_exp must be listed before storybody_reg_exp in keep_only_tags
# due to
# it being the parent of storybody_reg_exp, that is to say the div class/id
# 'story-body'
# will be inside div class/id 'blq_content' in the HTML (if 'blq_content' is
# there at
# all). If they are the other way around in keep_only_tags then blq_content_reg_
# exp
# will end up being discarded.

This recipe explores only the tip of the iceberg when it comes to the power of calibre. To explore more of the abilities of calibre we’ll examine a more complex real life example in the next section.

## 2.2.4 Real life example

A reasonably complex real life example that exposes more of the API of BasicNewsRecipe is the recipe for The New York Times

```python
import string, re
from calibre import strftime
from calibre.web.feeds.recipes import BasicNewsRecipe
from calibre.ebooks.BeautifulSoup import BeautifulSoup
class NYTimes(BasicNewsRecipe):
    title = 'The New York Times'
    __author__ = 'Kovid Goyal'
    description = 'Daily news from the New York Times'
    timefmt = ' [%a, %d %b, %Y]'
    needs_subscriptions = True
    remove_tags_before = dict(id='article')
    remove_tags_after = dict(id='article')
    remove_tags = [dict(attrs={'class': ['articleTools', 'post-tools', 'side_tool',
                        'nextArticleLink clearfix']},
                        id=['footer', 'toolsRight', 'articleInline', 'navigation',
                        'archive', 'side_search', 'blog_sidebar', 'side_tool', 'side_index']),
                        dict(name=['script', 'noscript', 'style'])]
    encoding = 'cp1252'
```

(continues on next page)
no_stylesheets = True
extra_css = 'h1 {font: sans-serif large;}\n.byline {font:monospace;}'

```python
def get_browser(self):
    br = BasicNewsRecipe.get_browser()
    if self.username is not None and self.password is not None:
        br.open('https://www.nytimes.com/auth/login')
        br.select_form(name='login')
        br['USERID'] = self.username
        br['PASSWORD'] = self.password
        br.submit()
    return br

def parse_index(self):
    
    def feed_title(div):
        return ''.join(div.findAll(text=True, recursive=False)).strip()

    articles = {}
    key = None
    ans = []
    for div in soup.findAll(True,
                             attrs={'class': ['section-headline', 'story', 'story headline']}):
        if div['class'] == 'section-headline':
            key = string.capwords(feed_title(div))
            articles[key] = []
            ans.append(key)
        elif div['class'] in ['story', 'story headline']:
            a = div.find('a', href=True)
            if not a:
                continue
            url = re.sub(r'\?.*', '', a['href'])
            url += '?pagewanted=all'
            title = self.tag_to_string(a, use_alt=True).strip()
            description = ''
            pubdate = strftime('%a, %d %b')
            summary = div.find(True, attrs={'class': 'summary'})
            if summary:
                description = self.tag_to_string(summary, use_alt=False)
            feed = key if key is not None else 'Uncategorized'
            if not articles.has_key(feed):
                articles[feed] = []
            if not 'podcasts' in url:
                articles[feed].append({
                    'title': title, 'url': url, 'date': pubdate,
                    'description': description,
                    'content': ''})
                ans = self.sort_index_by(ans,
                                        {'The Front Page': -1, 'Dining In, Dining Out': 1,
                                         'Obituaries': 2})
            ans = [(key, articles[key]) for key in ans if articles.has_key(key)]
    return ans
```

(continues on next page)
We see several new features in this recipe. First, we have:

def preprocess_html(self, soup):
    refresh = soup.find('meta', {'http-equiv':'refresh'})
    if refresh is None:
        return soup
    content = refresh.get('content').partition('=')[-1]
    return BeautifulSoup(raw.decode('cp1252', 'replace'))

This sets the displayed time on the front page of the created e-book to be in the format, Day, Day_Number Month, Year. See `timefmt` (page 55).

Then we see a group of directives to cleanup the downloaded HTML:

```python
remove_tags_before = dict(name='h1')
remove_tags_after = dict(id='footer')
remove_tags = ...
```

These remove everything before the first `<h1>` tag and everything after the first tag whose id is `footer`. See `remove_tags` (page 54), `remove_tags_before` (page 54), `remove_tags_after` (page 54).

The next interesting feature is:

```python
needs_subscription = True
...
```

`needs_subscription = True` tells calibre that this recipe needs a username and password in order to access the content. This causes, calibre to ask for a username and password whenever you try to use this recipe. The code in `calibre.web.feeds.news.BasicNewsRecipe.get_browser()` (page 48) actually does the login into the NYT website. Once logged in, calibre will use the same, logged in, browser instance to fetch all content. See `mechanize` to understand the code in `get_browser`.

The next new feature is the `calibre.web.feeds.news.BasicNewsRecipe.parse_index()` (page 49) method. Its job is to go to https://www.nytimes.com/pages/todayspaper/index.html and fetch the list of articles that appear in todays paper. While more complex than simply using RSS, the recipe creates an e-book that corresponds very closely to the days paper. `parse_index` makes heavy use of BeautifulSoup to parse the daily paper webpage. You can also use other, more modern parsers if you dislike BeautifulSoup. calibre comes with lxml and html5lib, which are the recommended parsers. To use them, replace the call to `index_to_soup()` with the following:

```python
raw = self.index_to_soup(url, raw=True)
# For html5lib
import html5lib
root = html5lib.parse(raw, namespaceHTMLElements=False, treebuilder='lxml')
# For the lxml html 4 parser
from lxml import html
root = html.fromstring(raw)
```

8 https://www.crummy.com/software/BeautifulSoup/bs3/documentation.html
9 http://lxml.de/
10 https://github.com/html5lib/html5lib-python

2.2. Customizing the fetch process
The final new feature is the `calibre.web.feeds.news.BasicNewsRecipe.preprocess_html()` (page 50) method. It can be used to perform arbitrary transformations on every downloaded HTML page. Here it is used to bypass the ads that the nytimes shows you before each article.

### 2.3 Tips for developing new recipes

The best way to develop new recipes is to use the command line interface. Create the recipe using your favorite Python editor and save it to a file say `myrecipe.recipe`. The `.recipe` extension is required. You can download content using this recipe with the command:

```
ebook-convert myrecipe.recipe .epub --test -vv --debug-pipeline debug
```

The command `ebook-convert` will download all the webpages and save them to the EPUB file `myrecipe.epub`. The `-vv` option makes ebook-convert spit out a lot of information about what it is doing. The `ebook-convert-recipe-input --test` option makes it download only a couple of articles from at most two feeds. In addition, ebook-convert will put the downloaded HTML into the `debug/input` directory, where `debug` is the directory you specified in the `ebook-convert --debug-pipeline` option.

Once the download is complete, you can look at the downloaded HTML by opening the file `debug/input/index.html` in a browser. Once you’re satisfied that the download and preprocessing is happening correctly, you can generate e-books in different formats as shown below:

```
ebook-convert myrecipe.recipe myrecipe.epub
ebook-convert myrecipe.recipe myrecipe.mobi
...
```

If you’re satisfied with your recipe, and you feel there is enough demand to justify its inclusion into the set of built-in recipes, post your recipe in the [calibre recipes forum](https://www.mobileread.com/forums/forumdisplay.php?f=228) to share it with other calibre users.

**Note:** On macOS, the command line tools are inside the calibre bundle, for example, if you installed calibre in `/Applications` the command line tools are in `/Applications/calibre.app/Contents/console.app/Contents/MacOS/`.

See also: `ebook-convert` (page ??) The command line interface for all e-book conversion.

### 2.4 Further reading

To learn more about writing advanced recipes using some of the facilities, available in BasicNewsRecipe you should consult the following sources:

- **API documentation** (page 47) Documentation of the BasicNewsRecipe class and all its important methods and fields.
- **BasicNewsRecipe** The source code of BasicNewsRecipe
- **Built-in recipes** The source code for the built-in recipes that come with calibre
- **The calibre recipes forum** Lots of knowledgeable calibre recipe writers hang out here.

---

2.5 API documentation

2.5.1 API documentation for recipes

The API for writing recipes is defined by the `BasicNewsRecipe` (page 47)

```python
class calibre.web.feeds.news.BasicNewsRecipe(options, log, progress_reporter)
Base class that contains logic needed in all recipes. By overriding progressively more of the functionality in this class, you can make progressively more customized/powerful recipes. For a tutorial introduction to creating recipes, see Adding your favorite news website (page ??).
```

```python
abort_article(msg=None)
Call this method inside any of the preprocess methods to abort the download for the current article. Useful to skip articles that contain inappropriate content, such as pure video articles.
```

```python
abort_recipe_processing(msg)
Causes the recipe download system to abort the download of this recipe, displaying a simple feedback message to the user.
```

```python
add_toc_thumbnail(article, src)
Call this from populate_article_metadata with the src attribute of an <img> tag from the article that is appropriate for use as the thumbnail representing the article in the Table of Contents. Whether the thumbnail is actually used is device dependent (currently only used by the Kindles). Note that the referenced image must be one that was successfully downloaded, otherwise it will be ignored.
```

```python
classmethod adeify_images(soup)
If your recipe when converted to EPUB has problems with images when viewed in Adobe Digital Editions, call this method from within postprocess_html() (page 50).
```

```python
canonicalize_internal_url(url, is_link=True)
Return a set of canonical representations of url. The default implementation uses just the server hostname and path of the URL, ignoring any query parameters, fragments, etc. The canonical representations must be unique across all URLs for this news source. If they are not, then internal links may be resolved incorrectly.

  Parameters
  is_link -- Is True if the URL is coming from an internal link in an HTML file. False if the URL is the URL used to download an article.
```

```python
cleanup()
Called after all articles have been download. Use it to do any cleanup like logging out of subscription sites, etc.
```

```python
clone_browser(br)
Clone the browser br. Cloned browsers are used for multi-threaded downloads, since mechanize is not thread safe. The default cloning routines should capture most browser customization, but if you do something exotic in your recipe, you should override this method in your recipe and clone manually.

Cloned browser instances use the same, thread-safe CookieJar by default, unless you have customized cookie handling.
```

```python
default_cover(cover_file)
Create a generic cover for recipes that don’t have a cover
```

```python
download()
Download and pre-process all articles from the feeds in this recipe. This method should be called only once on a particular Recipe instance. Calling it more than once will lead to undefined behavior. :return: Path to index.html
```
**extract_readable_article** *(html, url)*

Extracts main article content from ‘html’, cleans up and returns as a (article_html, extracted_title) tuple. Based on the original readability algorithm by Arc90.

**get_article_url** *(article)*

Override in a subclass to customize extraction of the **URL** that points to the content for each article. Return the article URL. It is called with article, an object representing a parsed article from a feed. See feedparser\(^{15}\). By default it looks for the original link (for feeds syndicated via a service like feedburner or pheedo) and if found, returns that or else returns article.link\(^{16}\).

**get_browser** *(\*args, **kwargs)*

Return a browser instance used to fetch documents from the web. By default it returns a mechanize\(^{17}\) browser instance that supports cookies, ignores robots.txt, handles refreshes and has a mozilla firefox user agent.

If your recipe requires that you login first, override this method in your subclass. For example, the following code is used in the New York Times recipe to login for full access:

```python
def get_browser(self):
    br = BasicNewsRecipe.get_browser(self)
    if self.username is not None and self.password is not None:
        br.open('https://www.nytimes.com/auth/login')
        br.select_form(name='login')
        br['USERID'] = self.username
        br['PASSWORD'] = self.password
        br.submit()
    return br
```

**get_cover_url** *

Return a **URL** to the cover image for this issue or None. By default it returns the value of the member self.cover_url which is normally None. If you want your recipe to download a cover for the e-book override this method in your subclass, or set the member variable self.cover_url before this method is called.

**get_extra_css** *

By default returns self.extra_css. Override if you want to programmatically generate the extra_css.

**get_feeds** *

Return a list of **RSS** feeds to fetch for this profile. Each element of the list must be a 2-element tuple of the form (title, url). If title is None or an empty string, the title from the feed is used. This method is useful if your recipe needs to do some processing to figure out the list of feeds to download. If so, override in your subclass.

**get_masthead_title** *

Override in subclass to use something other than the recipe title

**get_masthead_url** *

Return a **URL** to the masthead image for this issue or None. By default it returns the value of the member self.masthead_url which is normally None. If you want your recipe to download a masthead for the e-book override this method in your subclass, or set the member variable self.masthead_url before this method is called. Masthead images are used in Kindle MOBI files.

**get_obfuscated_article** *(url)*

If you set **articles_are_obfuscated** this method is called with every article URL. It should return the path to a file on the filesystem that contains the article HTML. That file is processed by the recursive HTML fetching engine, so it can contain links to pages/images on the web.

---

\(^{15}\) [https://pythonhosted.org/feedparser/](https://pythonhosted.org/feedparser/)

\(^{16}\) [https://pythonhosted.org/feedparser/reference-entry-link.html](https://pythonhosted.org/feedparser/reference-entry-link.html)

This method is typically useful for sites that try to make it difficult to access article content automatically.

```python
classmethod image_url_processor(baseurl, url)
```
Perform some processing on image urls (perhaps removing size restrictions for dynamically generated images, etc.) and return the preprocessed URL.

```python
index_to_soup(url_or_raw, raw=False, as_tree=False)
```
Convenience method that takes an URL to the index page and returns a BeautifulSoup\(^\text{18}\) of it.

- `url_or_raw`: Either a URL or the downloaded index page as a string

```python
is_link_wanted(url, tag)
```
Return True if the link should be followed or False otherwise. By default, raises NotImplementedError which causes the downloader to ignore it.

**Parameters**
- `url`: The URL to be followed
- `tag`: The tag from which the URL was derived

```python
parse_feeds()
```
Create a list of articles from the list of feeds returned by `BasicNewsRecipe.get_feeds()` (page 48). Return a list of `Feed` objects.

```python
parse_index()
```
This method should be implemented in recipes that parse a website instead of feeds to generate a list of articles. Typical uses are for news sources that have a “Print Edition” webpage that lists all the articles in the current print edition. If this function is implemented, it will be used in preference to `BasicNewsRecipe.parse_feeds()` (page 49).

It must return a list. Each element of the list must be a 2-element tuple of the form `(feed title, list of articles)`. Each list of articles must contain dictionaries of the form:

```
{
'title' : article title,
'url' : URL of print version,
'date' : The publication date of the article as a string,
'description' : A summary of the article
'content' : The full article (can be an empty string). Obsolete do not use, instead save the content to a temporary file and pass a file:///path/to/temp/file.html as the URL.
}
```

For an example, see the recipe for downloading The Atlantic. In addition, you can add ‘author’ for the author of the article.

If you want to abort processing for some reason and have calibre show the user a simple message instead of an error, call `abort_recipe_processing()` (page 47).

```python
populate_article_metadata(article, soup, first)
```
Called when each HTML page belonging to article is downloaded. Intended to be used to get article metadata like author/summary/etc. from the parsed HTML (soup).

**Parameters**
- `article`: A object of class `calibre.web.feeds.Article`. If you change the summary, remember to also change the `text_summary`

\(^\text{18}\) https://www.crummy.com/software/BeautifulSoup/bs3/documentation.html
postprocess_book (oeb, opts, log)
Run any needed post processing on the parsed downloaded e-book.

Parameters

- oeb – An OEBBook object
- opts – Conversion options

postprocess_html (soup, first_fetch)
This method is called with the source of each downloaded HTML file, after it is parsed for links and images. It can be used to do arbitrarily powerful post-processing on the HTML. It should return soup after processing it.

Parameters

- soup – A BeautifulSoup\(^{19}\) instance containing the downloaded HTML.
- first_fetch – True if this is the first page of an article.

preprocess_html (soup)
This method is called with the source of each downloaded HTML file, before it is parsed for links and images. It is called after the cleanup as specified by remove_tags etc. It can be used to do arbitrarily powerful pre-processing on the HTML. It should return soup after processing it.

soup: A BeautifulSoup\(^{20}\) instance containing the downloaded HTML.

preprocess_image (img_data, image_url)
Perform some processing on downloaded image data. This is called on the raw data before any resizing is done. Must return the processed raw data. Return None to skip the image.

preprocess_raw_html (raw_html, url)
This method is called with the source of each downloaded HTML file, before it is parsed into an object tree. raw_html is a unicode string representing the raw HTML downloaded from the web. url is the URL from which the HTML was downloaded.

Note that this method acts before preprocess_regexps.

This method must return the processed raw_html as a unicode object.

classmethod print_version (url)
Take a url pointing to the webpage with article content and return the URL pointing to the print version of the article. By default does nothing. For example:

```python
def print_version(self, url):
    return url + '?&pagewanted=print'
```

skip_ad_pages (soup)
This method is called with the source of each downloaded HTML file, before any of the cleanup attributes like remove_tags, keep_only_tags are applied. Note that preprocess_regexps will have already been applied. It is meant to allow the recipe to skip ad pages. If the soup represents an ad page, return the HTML of the real page. Otherwise return None.

soup: A BeautifulSoup\(^{21}\) instance containing the downloaded HTML.

---

\(^{19}\) https://www.crummy.com/software/BeautifulSoup/bs3/documentation.html
\(^{20}\) https://www.crummy.com/software/BeautifulSoup/bs3/documentation.html
\(^{21}\) https://www.crummy.com/software/BeautifulSoup/bs3/documentation.html
sort_index_by (index, weights)
Convenience method to sort the titles in index according to weights. index is sorted in place. Returns index.

index: A list of titles.
weights: A dictionary that maps weights to titles. If any titles in index are not in weights, they are assumed to have a weight of 0.

classmethod tag_to_string (tag, use_alt=True, normalize_whitespace=True)
Convenience method to take a BeautifulSoup Tag and extract the text from it recursively, including any CDATA sections and alt tag attributes. Return a possibly empty unicode string.

use_alt: If True try to use the alt attribute for tags that don’t have any textual content

tag: BeautifulSoup Tag

articles_are_obfuscated = False
Set to True and implement get_obfuscated_article() (page 48) to handle websites that try to make it difficult to scrape content.

auto_cleanup = False
Automatically extract all the text from downloaded article pages. Uses the algorithms from the readability project. Setting this to True, means that you do not have to worry about cleaning up the downloaded HTML manually (though manual cleanup will always be superior).

auto_cleanup_keep = None
Specify elements that the auto cleanup algorithm should never remove. The syntax is a XPath expression. For example:

```
auto_cleanup_keep = '//div[@id="article-image"]' will keep all divs with id="article-image"
auto_cleanup_keep = '//*[@class="important"]' will keep all elements with class="important"
auto_cleanup_keep = '//div[@id="article-image"]//*[@class="important"]' will keep all divs with id="article-image" and spans with class="important"
```

center_navbar = True
If True the navigation bar is center aligned, otherwise it is left aligned

compress_news_images = False
Set this to False to ignore all scaling and compression parameters and pass images through unmodified. If True and the other compression parameters are left at their default values, jpeg images will be scaled to fit in the screen dimensions set by the output profile and compressed to size at most (w * h)/16 where w x h are the scaled image dimensions.

compress_news_images_auto_size = 16
The factor used when auto compressing jpeg images. If set to None, auto compression is disabled. Otherwise, the images will be reduced in size to (w * h)/compress_news_images_auto_size bytes if possible by reducing the quality level, where w x h are the image dimensions in pixels. The minimum jpeg quality will be 5/100 so it is possible this constraint will not be met. This parameter can be overridden by the parameter compress_news_images_max_size which provides a fixed maximum size for images. Note that if you enable scale_news_images_to_device then the image will first be scaled and then its quality lowered until its size is less than (w * h)/factor where w and h are now the scaled image dimensions. In other words, this compression happens after scaling.

compress_news_images_max_size = None
Set jpeg quality so images do not exceed the size given (in KBytes). If set, this parameter overrides

---

22 https://www.crummy.com/software/BeautifulSoup/bs3/documentation.html
23 https://www.crummy.com/software/BeautifulSoup/bs3/documentation.html
auto compression via compress_news_images_auto_size. The minimum jpeg quality will be 5/100 so it is possible this constraint will not be met.

**conversion_options = {}**

Recipe specific options to control the conversion of the downloaded content into an e-book. These will override any user or plugin specified values, so only use if absolutely necessary. For example:

```python
classical_options = {
    'base_font_size': 16,
    'tags': 'mytag1,mytag2',
    'title': 'My Title',
    'linearize_tables': True,
}
```

**cover_margins = (0, 0, '#ffffff')**

By default, the cover image returned by get_cover_url() will be used as the cover for the periodical. Overriding this in your recipe instructs calibre to render the downloaded cover into a frame whose width and height are expressed as a percentage of the downloaded cover. `cover_margins = (10, 15, '#ffffff')` pads the cover with a white margin 10px on the left and right, 15px on the top and bottom. Color names defined at https://www.imagemagick.org/script/color.php Note that for some reason, white does not always work in Windows. Use #ffffff instead

**delay = 0**

Delay between consecutive downloads in seconds. The argument may be a floating point number to indicate a more precise time.

**description = u''**

A couple of lines that describe the content this recipe downloads. This will be used primarily in a GUI that presents a list of recipes.

**encoding = None**

Specify an override encoding for sites that have an incorrect charset specification. The most common being specifying latin1 and using cp1252. If None, try to detect the encoding. If it is a callable, the callable is called with two arguments: The recipe object and the source to be decoded. It must return the decoded source.

**extra_css = None**

Specify any extra CSS that should be added to downloaded HTML files. It will be inserted into <style> tags, just before the closing </head> tag thereby overriding all CSS except that which is declared using the style attribute on individual HTML tags. Note that if you want to programmatically generate the extra_css override the get_extra_css() (page 48) method instead. For example:

```python
extra_css = '.heading { font: serif x-large }
```

**feeds = None**

List of feeds to download. Can be either [url1, url2, ...] or [('title1', url1), ('title2', url2),...]

**filter_regexps = []**

List of regular expressions that determines which links to ignore. If empty it is ignored. Used only if is_link_wanted is not implemented. For example:

```python
filter_regexps = [r'ads\doubleclick\.net']
```

will remove all URLs that have ads.doubleclick.net in them.

Only one of `BasicNewsRecipe.match_regexps` (page 53) or `BasicNewsRecipe.filter_regexps` (page 52) should be defined.
**handle_gzip = False**
Set to True if you want to use gzipped transfers. Note that some old servers flake out with this so it is off by default.

**ignore_duplicate_articles = None**
Ignore duplicates of articles that are present in more than one section. A duplicate article is an article that has the same title and/or URL. To ignore articles with the same title, set this to:

```python
ignore_duplicate_articles = {'title'}
```

To use URLs instead, set it to:

```python
ignore_duplicate_articles = {'url'}
```

To match on title or URL, set it to:

```python
ignore_duplicate_articles = {'title', 'url'}
```

**keep_only_tags = []**
Keep only the specified tags and their children. For the format for specifying a tag see `BasicNewsRecipe.remove_tags` (page 54). If this list is not empty, then the `<body>` tag will be emptied and re-filled with the tags that match the entries in this list. For example:

```python
keep_only_tags = [dict(id=['content', 'heading'])]
```

will keep only tags that have an `id` attribute of “content” or “heading”.

**language = ‘und’**
The language that the news is in. Must be an ISO-639 code either two or three characters long

**masthead_url = None**
By default, calibre will use a default image for the masthead (Kindle only). Override this in your recipe to provide a url to use as a masthead.

**match_regexps = []**
List of regular expressions that determines which links to follow. If empty, it is ignored. Used only if `is_link_wanted` is not implemented. For example:

```python
match_regexps = [r'page=[0-9]+']
```

will match all URLs that have `page=some number` in them.

Only one of `BasicNewsRecipe.match_regexps` (page 53) or `BasicNewsRecipe.filter_regexps` (page 52) should be defined.

**max_articles_per_feed = 100**
Maximum number of articles to download from each feed. This is primarily useful for feeds that don’t have article dates. For most feeds, you should use `BasicNewsRecipe.oldest_article` (page 53)

**needs_subscription = False**
If True the GUI will ask the user for a username and password to use while downloading. If set to “optional” the use of a username and password becomes optional

**no_stylesheets = False**
Convenient flag to disable loading of stylesheets for websites that have overly complex stylesheets unsuitable for conversion to e-book formats. If True stylesheets are not downloaded and processed

**oldest_article = 7.0**
Oldest article to download from this news source. In days.
**preprocess_regexps** = []

List of *regexp* substitution rules to run on the downloaded *HTML*. Each element of the list should be a two element tuple. The first element of the tuple should be a compiled regular expression and the second a callable that takes a single match object and returns a string to replace the match. For example:

```python
preprocess_regexps = [
    (re.compile(r'<!--Article ends here-->.*</body>', re.DOTALL|re.IGNORECASE), lambda match: '</body>'),
]
```

will remove everything from `<!–Article ends here–>` to `</body>`.

**publication_type** = 'unknown'
Publication type Set to newspaper, magazine or blog. If set to None, no publication type metadata will be written to the opf file.

**recipe_disabled** = None
Set to a non empty string to disable this recipe. The string will be used as the disabled message

**recursions** = 0
Number of levels of links to follow on article webpages

**remove_attributes** = []
List of attributes to remove from all tags. For example:

```python
remove_attributes = ['style', 'font']
```

**remove_empty_feeds** = False
If True empty feeds are removed from the output. This option has no effect if parse_index is overridden in the sub class. It is meant only for recipes that return a list of feeds using *feeds* or *get_feeds()* (page 48). It is also used if you use the ignore_duplicate_articles option.

**remove_javascript** = True
Convenient flag to strip all javascript tags from the downloaded HTML

**remove_tags** = []
List of tags to be removed. Specified tags are removed from downloaded HTML. A tag is specified as a dictionary of the form:

```python
{
    'name' : 'tag name',  # e.g. 'div'
    'attrs' : a dictionary,  # e.g. {'class': 'advertisment'}
}
```

All keys are optional. For a full explanation of the search criteria, see Beautiful Soup[^24] A common example:

```python
remove_tags = [dict(name='div', attrs={'class': 'advert'})]
```

This will remove all `<div class="advert">` tags and all their children from the downloaded *HTML*.

**remove_tags_after** = None
Remove all tags that occur after the specified tag. For the format for specifying a tag see *BasicNewsRecipe.remove_tags* (page 54). For example:

```python
remove_tags_after = [dict(id='content')]
```

will remove all tags after the first element with *id*="content".

[^24]: https://www.crummy.com/software/BeautifulSoup/bs3/documentation.html#Searching%20the%20Parse%20Tree

---

54 Chapter 2. Adding your favorite news website
**remove_tags_before** = None
Remove all tags that occur before the specified tag. For the format for specifying a tag see `BasicNewsRecipe.remove_tags` (page 54). For example:

```python
remove_tags_before = dict(id='content')
```

will remove all tags before the first element with id="content".

**requires_version** = (0, 6, 0)
Minimum calibre version needed to use this recipe

**resolve_internal_links** = False
If set to True then links in downloaded articles that point to other downloaded articles are changed to point
to the downloaded copy of the article rather than its original web URL. If you set this to True, you might
also need to implement `canonicalize_internal_url()` (page 47) to work with the URL scheme
of your particular website.

**reverse_article_order** = False
Reverse the order of articles in each feed

**scale_news_images** = None
Maximum dimensions (w,h) to scale images to. If scale_news_images_to_device is True this is set to the
device screen dimensions set by the output profile unless there is no profile set, in which case it is left at
whatever value it has been assigned (default None).

**scale_news_images_to_device** = True
Rescale images to fit in the device screen dimensions set by the output profile. Ignored if no output profile
is set.

**simultaneous_downloads** = 5
Number of simultaneous downloads. Set to 1 if the server is picky. Automatically reduced to 1 if
`BasicNewsRecipe.delay` (page 52) > 0

**summary_length** = 500
Max number of characters in the short description

**template_css** = u'
 .article_date {
 color: gray; font-family: monospace;
 }

 .article_description {
 text-indent: ... bold; text-align:left;
 }

 a.feed {
 font-weight: bold;
 }

 .calibre_navbar {
 font-family:monospace;
 }
 'The CSS that is used to style the templates, i.e., the navigation bars and the Tables of Contents. Rather
than overriding this variable, you should use `extra_css` in your recipe to customize look and feel.

**timefmt** = ' [%a, %d %b %Y]
The format string for the date shown on the first page. By default: Day_Name, Day_Number Month_Name Year

**timeout** = 120.0
Timeout for fetching files from server in seconds

**title** = u'Unknown News Source'
The title to use for the e-book

**use_embedded_content** = None
Normally we try to guess if a feed has full articles embedded in it based on the length of the embedded
content. If None, then the default guessing is used. If True then the we always assume the feeds has
embedded content and if False we always assume the feed does not have embedded content.
calibre includes a built-in E-book viewer that can view all the major e-book formats. The E-book viewer is highly customizable and has many advanced features.

- Starting the E-book viewer (page 57)
- Navigating around an e-book (page 57)
- Customizing the look and feel of your reading experience (page 60)
- Dictionary lookup (page 60)
- Copying text and images (page 60)

### 3.1 Starting the E-book viewer

You can view any of the books in your calibre library by selecting the book and pressing the View button. This will open up the book in the E-book viewer. You can also launch the E-book viewer by itself from the Start menu in Windows or using the command `ebook-viewer` in Linux and macOS (you have to install the command line tools on macOS first by going to Preferences→Advanced→Miscellaneous).

### 3.2 Navigating around an e-book

You can “turn pages” in a book by using the Page previous and Page next buttons, or by pressing the Page down/Page up keys. Unlike most e-book viewers, calibre does not force you to view books in paged mode. You can switch to flow mode by clicking on the scroll mode button at the top right. You can then scroll by amounts...
less than a page by using the scroll bar or various customizable keyboard shortcuts.

3.2.1 Bookmarks

When you are in the middle of a book and close the viewer, it will remember where you stopped reading and return there the next time you open the book. You can also set bookmarks in the book by using the Bookmark button. When viewing EPUB format books, these bookmarks are actually saved in the EPUB file itself. You can add bookmarks, then send the file to a friend. When they open the file, they will be able to see your bookmarks.

3.2.2 Table of Contents

If the book you are reading defines a Table of Contents, you can access it by pressing the Table of Contents button. This will bring up a list of sections in the book. You can click on any of them to jump to that portion of the book.

3.2.3 Navigating by location

E-books, unlike paper books, have no concept of pages. Instead, as you read through the book, you will notice that your position in the book is displayed in the upper left corner in a box like this. This is both your current position and the total length of the book. These numbers are independent of the screen size and font size you are viewing the book at, and they play a similar role to page numbers in paper books. You can enter any number you like to go to the corresponding location in the book.

calibre also has a very handy reference mode. You can turn it on by clicking the Reference mode button. Once you do this, every time you move your mouse over a paragraph, calibre will display a unique number made up of the section and paragraph numbers.
November 1918, Hobson, Lancashire

She stood in front of the cheval glass, the long mirror that Peter had given her on their second anniversary, and considered herself. Her hair had faded from shimmering English fair to almost the color of straw, and her face was lined from working in the vegetable beds throughout the war, though she’d worn a hat and gloves. Her skin, once like silk—he’d always told her that—was showing faint lines, and her eyes, though still very blue, stared back at her from some other woman’s old face.

Four years—have I really aged that much in four years? she asked her image.

With a sigh she accepted the fact that she wouldn’t see forty-four again. But he’d have aged too. Probably more than she had—war was no seaside picnic on a summer’s afternoon.

That thought failed to cheer her. She wanted to review and examine in...
3.3 Customizing the look and feel of your reading experience

You can change font sizes on the fly by using the font size buttons. You can also make the viewer full screen by pressing the Full Screen button. By clicking the Preferences button, you can change the default fonts used by the viewer to ones you like as well as the default font size when the viewer starts up.

More advanced customization can be achieved by the User stylesheet setting. This is a stylesheet you can set that will be applied to every book. Using it you can do things like have white text on a black background, change paragraph styles, text justification, etc. For examples of custom stylesheets used by calibre’s users, see the forums.

3.4 Dictionary lookup

You can look up the meaning of words in the current book by right clicking on a word. calibre uses the publicly available dictionary server at dict.org to look up words. The definition is displayed in a small box at the bottom of the screen.

3.5 Copying text and images

You can select text and images by dragging the content with your mouse and then right clicking to copy to the clipboard. The copied material can be pasted into another application as plain text and images.

---

calibre has a conversion system that is designed to be very easy to use. Normally, you just add a book to calibre, click convert and calibre will try hard to generate output that is as close as possible to the input. However, calibre accepts a very large number of input formats, not all of which are as suitable as others for conversion to e-books. In the case of such input formats, or if you just want greater control over the conversion system, calibre has a lot of options to fine tune the conversion process. Note however that calibre’s conversion system is not a substitute for a full blown e-book editor. To edit e-books, I recommend first converting them to EPUB or AZW3 using calibre and then using the Edit book feature to get them into perfect shape. You can then use the edited e-book as input for conversion into other formats in calibre.

This document will refer mainly to the conversion settings as found in the conversion dialog, pictured below. All these settings are also available via command line interface to conversion, documented at ebook-convert (page ??). In calibre, you can obtain help on any individual setting by holding your mouse over it, a tooltip will appear describing the setting.
Contents

- Introduction (page 63)
- Look & feel (page 64)
- Page setup (page 67)
- Heuristic processing (page 67)
- Search & replace (page 68)
- Structure detection (page 69)
- Table of Contents (page 70)
- Using images as chapter titles when converting HTML input documents (page 71)
- Using tag attributes to supply the text for entries in the Table of Contents (page 72)
- How options are set/saved for Conversion (page 72)
- Format specific tips (page 73)
4.1 Introduction

The first thing to understand about the conversion system is that it is designed as a pipeline. Schematically, it looks like this:

The input format is first converted to XHTML by the appropriate Input plugin. This HTML is then transformed. In the last step, the processed XHTML is converted to the specified output format by the appropriate Output plugin. The results of the conversion can vary greatly, based on the input format. Some formats convert much better than others. A list of the best source formats for conversion is available here (page 130).

The transforms that act on the XHTML output are where all the work happens. There are various transforms, for example, to insert book metadata as a page at the start of the book, to detect chapter headings and automatically create a Table of Contents, to proportionally adjust font sizes, et cetera. It is important to remember that all the transforms act on the XHTML output by the Input plugin, not on the input file itself. So, for example, if you ask calibre to convert an RTF file to EPUB, it will first be converted to XHTML internally, the various transforms will be applied to the XHTML and then the Output plugin will create the EPUB file, automatically generating all metadata, Table of Contents, et cetera.
You can see this process in action by using the debug option. Just specify the path to a directory for the debug output. During conversion, calibre will place the XHTML generated by the various stages of the conversion pipeline in different sub-directories. The four sub-directories are:

<table>
<thead>
<tr>
<th>Directory</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input</td>
<td>This contains the HTML output by the Input plugin. Use this to debug the Input plugin.</td>
</tr>
<tr>
<td>parsed</td>
<td>The result of pre-processing and converting to XHTML the output from the Input plugin. Use to debug structure detection.</td>
</tr>
<tr>
<td>structure</td>
<td>Post structure detection, but before CSS flattening and font size conversion. Use to debug font size conversion and CSS transforms.</td>
</tr>
<tr>
<td>processed</td>
<td>Just before the e-book is passed to the Output plugin. Use to debug the Output plugin.</td>
</tr>
</tbody>
</table>

If you want to edit the input document a little before having calibre convert it, the best thing to do is edit the files in the input sub-directory, then zip it up, and use the ZIP file as the input format for subsequent conversions. To do this use the Edit meta information dialog to add the ZIP file as a format for the book and then, in the top left corner of the conversion dialog, select ZIP as the input format.

This document will deal mainly with the various transforms that operate on the intermediate XHTML and how to control them. At the end are some tips specific to each input/output format.

### 4.2 Look & feel

This group of options controls various aspects of the look and feel of the converted e-book.

#### 4.2.1 Fonts

One of the nicest features of the e-reading experience is the ability to easily adjust font sizes to suit individual needs and lighting conditions. calibre has sophisticated algorithms to ensure that all the books it outputs have a consistent font sizes, no matter what font sizes are specified in the input document.

The base font size of a document is the most common font size in that document, i.e., the size of the bulk of text in that document. When you specify a base font size, calibre automatically rescales all font sizes in the document proportionately, so that the most common font size becomes the specified base font size and other font sizes are
rescaled appropriately. By choosing a larger base font size, you can make the fonts in the document larger and vice versa. When you set the base font size, for best results, you should also set the font size key.

Normally, calibre will automatically choose a base font size appropriate to the output profile you have chosen (see *Page setup* (page 67)). However, you can override this here in case the default is not suitable for you.

The *Font size key* option lets you control how non-base font sizes are rescaled. The font rescaling algorithm works using a font size key, which is simply a comma-separated list of font sizes. The font size key tells calibre how many “steps” bigger or smaller a given font size should be compared to the base font size. The idea is that there should be a limited number of font sizes in a document. For example, one size for the body text, a couple of sizes for different levels of headings and a couple of sizes for super/sub scripts and footnotes. The font size key allows calibre to compartmentalize the font sizes in the input documents into separate “bins” corresponding to the different logical font sizes.

Let’s illustrate with an example. Suppose the source document we are converting was produced by someone with excellent eyesight and has a base font size of 8pt. That means the bulk of the text in the document is sized at 8pts, while headings are somewhat larger (say 10 and 12pt) and footnotes somewhat smaller at 6pt. Now if we use the following settings:

<table>
<thead>
<tr>
<th>Base font size</th>
<th>12pt</th>
</tr>
</thead>
<tbody>
<tr>
<td>Font size key</td>
<td>7, 8, 10, 12, 14, 16, 18, 20</td>
</tr>
</tbody>
</table>

The output document will have a base font size of 12pt, headings of 14 and 16pt and footnotes of 8pt. Now suppose we want to make the largest heading size stand out more and make the footnotes a little larger as well. To achieve this, the font key should be changed to:

| New font size key | 7, 9, 12, 14, 18, 20, 22 |

The largest headings will now become 18pt, while the footnotes will become 9pt. You can play with these settings to try and figure out what would be optimum for you by using the font rescaling wizard, which can be accessed by clicking the little button next to the *Font size key* setting.

All the font size rescaling in the conversion can also be disabled here, if you would like to preserve the font sizes in the input document.

A related setting is *Line height*. Line height controls the vertical height of lines. By default, (a line height of 0), no manipulation of line heights is performed. If you specify a non-default value, line heights will be set in all locations that don’t specify their own line heights. However, this is something of a blunt weapon and should be used sparingly. If you want to adjust the line heights for some section of the input, it’s better to use the *Extra CSS* (page 66).

In this section you can also tell calibre to embed any referenced fonts into the book. This will allow the fonts to work on reader devices even if they are not available on the device.

### 4.2.2 Text

Text can be either justified or not. Justified text has extra spaces between words to give a smooth right margin. Some people prefer justified text, others do not. Normally, calibre will preserve the justification in the original document. If you want to override it you can use the *Text justification* option in this section.

You can also tell calibre to *Smarten punctuation* which will replace plain quotes, dashes and ellipses with their typographically correct alternatives. Note that this algorithm is not perfect so it is worth reviewing the results. The reverse, namely, *Unsmarted punctuation* is also available.

Finally, there is *Input character encoding*. Older documents sometimes don’t specify their character encoding. When converted, this can result in non-English characters or special characters like smart quotes being corrupted. calibre tries to auto-detect the character encoding of the source document, but it does not always succeed. You can force it to assume a particular character encoding by using this setting. *cp1252* is a common encoding for documents produced...
using Windows software. You should also read How do I convert my file containing non-English characters, or smart quotes? (page 130) for more on encoding issues.

4.2.3 Layout

Normally, paragraphs in XHTML are rendered with a blank line between them and no leading text indent. calibre has a couple of options to control this. Remove spacing between paragraphs forcefully ensure that all paragraphs have no inter paragraph spacing. It also sets the text indent to 1.5em (can be changed) to mark the start of every paragraph. Insert blank line does the opposite, guaranteeing that there is exactly one blank line between each pair of paragraphs. Both these options are very comprehensive, removing spacing, or inserting it for all paragraphs (technically <p> and <div> tags). This is so that you can just set the option and be sure that it performs as advertised, irrespective of how messy the input file is. The one exception is when the input file uses hard line breaks to implement inter-paragraph spacing.

If you want to remove the spacing between all paragraphs, except a select few, don’t use these options. Instead add the following CSS code to Extra CSS (page 66):

```css
p, div { margin: 0pt; border: 0pt; text-indent: 1.5em }
.spacious { margin-bottom: 1em; text-indent: 0pt; }
```

Then, in your source document, mark the paragraphs that need spacing with class="spacious". If your input document is not in HTML, use the Debug option, described in the Introduction to get HTML (use the input sub-directory).

Another useful options is Linearize tables. Some badly designed documents use tables to control the layout of text on the page. When converted these documents often have text that runs off the page and other artifacts. This option will extract the content from the tables and present it in a linear fashion. Note that this option linearizes all tables, so only use it if you are sure the input document does not use tables for legitimate purposes, like presenting tabular information.

4.2.4 Styling

The Extra CSS option allows you to specify arbitrary CSS that will be applied to all HTML files in the input. This CSS is applied with very high priority and so should override most CSS present in the input document itself. You can use this setting to fine tune the presentation/layout of your document. For example, if you want all paragraphs of class endnote to be right aligned, just add:

```css
.endnote { text-align: right }
```

or if you want to change the indentation of all paragraphs:

```css
p { text-indent: 5mm; }
```

Extra CSS is a very powerful option, but you do need an understanding of how CSS works to use it to its full potential. You can use the debug pipeline option described above to see what CSS is present in your input document.

A simpler option is to use Filter style information. This allows you to remove all CSS properties of the specified types from the document. For example, you can use it to remove all colors or fonts.

4.2.5 Transform styles

This is the most powerful styling related facility. You can use it to define rules that change styles based on various conditions. For example you can use it to change all green colors to blue, or remove all bold styling from the text or color all headings a certain color, etc.
4.3 Page setup

The *Page setup* options are for controlling screen layout, like margins and screen sizes. There are options to setup page margins, which will be used by the output plugin, if the selected output format supports page margins. In addition, you should choose an Input profile and an output profile. Both sets of profiles basically deal with how to interpret measurements in the input/output documents, screen sizes and default font rescaling keys.

If you know that the file you are converting was intended to be used on a particular device/software platform, choose the corresponding input profile, otherwise just choose the default input profile. If you know the files you are producing are meant for a particular device type, choose the corresponding output profile. In particular, for MOBI output files, you should choose the Kindle, for LIT the Microsoft Reader and for EPUB the Sony Reader. In the case of EPUB, the Sony Reader profile will result in EPUB files that will work everywhere. However, it has some side effects, like inserting artificial section breaks to keep internal components below the size threshold, needed for SONY devices. In particular for the iPhone/Android phones, choose the SONY output profile. If you know your EPUB files will not be read on a SONY or similar device, use the default output profile. If you are producing MOBI files that are not intended for the Kindle, choose the Mobipocket books output profile.

The output profile also controls the screen size. This will cause, for example, images to be auto-resized to be fit to the screen in some output formats. So choose a profile of a device that has a screen size similar to your device.

4.4 Heuristic processing

Heuristic processing provides a variety of functions which can be used to try and detect and correct common problems in poorly formatted input documents. Use these functions if your input document suffers from poor formatting. Because these functions rely on common patterns, be aware that in some cases an option may lead to worse results, so use with care. As an example, several of these options will remove all non-breaking-space entities, or may include false positive matches relating to the function.

*Enable heuristic processing* This option activates calibre’s *Heuristic processing* stage of the conversion pipeline.

This must be enabled in order for various sub-functions to be applied

*Unwrap lines* Enabling this option will cause calibre to attempt to detect and correct hard line breaks that exist within a document using punctuation clues and line length. calibre will first attempt to detect whether hard line breaks exist, if they do not appear to exist calibre will not attempt to unwrap lines. The line-unwrap factor can be reduced if you want to ‘force’ calibre to unwrap lines.

*Line-unwrap factor* This option controls the algorithm calibre uses to remove hard line breaks. For example, if the value of this option is 0.4, that means calibre will remove hard line breaks from the end of lines whose lengths are less than the length of 40% of all lines in the document. If your document only has a few line breaks which need correction, then this value should be reduced to somewhere between 0.1 and 0.2.

*Detect and markup unformatted chapter headings and sub headings* If your document does not have chapter headings and titles formatted differently from the rest of the text, calibre can use this option to attempt detection them and surround them with heading tags. `<h2>` tags are used for chapter headings; `<h3>` tags are used for any titles that are detected.

This function will not create a TOC, but in many cases it will cause calibre’s default chapter detection settings to correctly detect chapters and build a TOC. Adjust the XPath under Structure detection if a TOC is not automatically created. If there are no other headings used in the document then setting “/h:h2” under Structure detection would be the easiest way to create a TOC for the document.

The inserted headings are not formatted, to apply formatting use the *Extra CSS* option under the Look and Feel conversion settings. For example, to center heading tags, use the following:

```css
h2, h3 { text-align: center }
```
Renumber sequences of `<h1>` or `<h2>` tags Some publishers format chapter headings using multiple `<h1>` or `<h2>` tags sequentially. calibre’s default conversion settings will cause such titles to be split into two pieces. This option will re-number the heading tags to prevent splitting.

Delete blank lines between paragraphs This option will cause calibre to analyze blank lines included within the document. If every paragraph is interleaved with a blank line, then calibre will remove all those blank paragraphs. Sequences of multiple blank lines will be considered scene breaks and retained as a single paragraph. This option differs from the ‘Remove Paragraph Spacing’ option under ‘Look and Feel’ in that it actually modifies the HTML content, while the other option modifies the document styles. This option can also remove paragraphs which were inserted using calibre’s ‘Insert blank line’ option.

Ensure scene breaks are consistently formatted With this option calibre will attempt to detect common scene-break markers and ensure that they are center aligned. ‘Soft’ scene break markers, i.e. scene breaks only defined by extra white space, are styled to ensure that they will not be displayed in conjunction with page breaks.

Replace scene breaks If this option is configured then calibre will replace scene break markers it finds with the replacement text specified by the user. Please note that some ornamental characters may not be supported across all reading devices.

In general you should avoid using HTML tags, calibre will discard any tags and use pre-defined markup. `<hr />` tags, i.e. horizontal rules, and `<img>` tags are exceptions. Horizontal rules can optionally be specified with styles, if you choose to add your own style be sure to include the ‘width’ setting, otherwise the style information will be discarded. Image tags can used, but calibre does not provide the ability to add the image during conversion, this must be done after the fact using the ‘Edit book’ feature.

Example image tag (place the image within an ‘Images’ folder inside the epub after conversion):
```
<img style="width:10%" src="/Images/scenebreak.png" />
```

Example horizontal rule with styles:
```
<hr style="width:20%;padding-top: 1px;border-top: 2px ridge black;border-bottom: 2px groove black;"/>
```

Remove unnecessary hyphens calibre will analyze all hyphenated content in the document when this option is enabled. The document itself is used as a dictionary for analysis. This allows calibre to accurately remove hyphens for any words in the document in any language, along with made-up and obscure scientific words. The primary drawback is words appearing only a single time in the document will not be changed. Analysis happens in two passes, the first pass analyzes line endings. Lines are only unwrapped if the word exists with or without a hyphen in the document. The second pass analyzes all hyphenated words throughout the document, hyphens are removed if the word exists elsewhere in the document without a match.

Italicize common words and patterns When enabled, calibre will look for common words and patterns that denote italics and italicize them. Examples are common text conventions such as ~word~ or phrases that should generally be italicized, e.g. latin phrases like ‘etc.’ or ‘et cetera’.

Replace entity indents with CSS indents Some documents use a convention of defining text indents using non-breaking space entities. When this option is enabled calibre will attempt to detect this sort of formatting and convert them to a 3% text indent using CSS.

4.5 Search & replace

These options are useful primarily for conversion of PDF documents or OCR conversions, though they can also be used to fix many document specific problems. As an example, some conversions can leaves behind page headers and footers in the text. These options use regular expressions to try and detect headers, footers, or other arbitrary text and remove or replace them. Remember that they operate on the intermediate XHTML produced by the conversion pipeline. There is a wizard to help you customize the regular expressions for your document. Click the magic wand beside the expression box, and click the ‘Test’ button after composing your search expression. Successful matches will be highlighted in Yellow.
The search works by using a Python regular expression. All matched text is simply removed from the document or replaced using the replacement pattern. The replacement pattern is optional, if left blank then text matching the search pattern will be deleted from the document. You can learn more about regular expressions and their syntax at *All about using regular expressions in calibre* (page 193).

### 4.6 Structure detection

Structure detection involves calibre trying its best to detect structural elements in the input document, when they are not properly specified. For example, chapters, page breaks, headers, footers, etc. As you can imagine, this process varies widely from book to book. Fortunately, calibre has very powerful options to control this. With power comes complexity, but if once you take the time to learn the complexity, you will find it well worth the effort.

#### 4.6.1 Chapters and page breaks

calibre has two sets of options for *chapter detection* and *inserting page breaks*. This can sometimes be slightly confusing, as by default, calibre will insert page breaks before detected chapters as well as the locations detected by the page breaks option. The reason for this is that there are often location where page breaks should be inserted that are not chapter boundaries. Also, detected chapters can be optionally inserted into the auto generated Table of Contents.

calibre uses *XPath*, a powerful language to allow the user to specify chapter boundaries/page breaks. XPath can seem a little daunting to use at first, fortunately, there is a *XPath tutorial* (page 159) in the User Manual. Remember that Structure detection operates on the intermediate XHTML produced by the conversion pipeline. Use the debug option described in the *Introduction* (page 63) to figure out the appropriate settings for your book. There is also a button for a XPath wizard to help with the generation of simple XPath expressions.

By default, calibre uses the following expression for chapter detection:

```xml
//*[(@class='chapter' or (name()='h1' or name()='h2') and re:test(., 'chapter|book|section|part\s+', 'i'))]
```

This expression is rather complex, because it tries to handle a number of common cases simultaneously. What it means is that calibre will assume chapters start at either `<h1>` or `<h2>` tags that have any of the words *(chapter, book, section or part)* in them or that have the `class='chapter'` attribute.

A related option is *Chapter mark*, which allows you to control what calibre does when it detects a chapter. By default, it will insert a page break before the chapter. You can have it insert a ruled line instead of, or in addition to the page break. You can also have it do nothing.

The default setting for detecting page breaks is:

```xml
//*[name()='h1' or name()='h2']
```

which means that calibre will insert page breaks before every `<h1>` and `<h2>` tag by default.

**Note:** The default expressions may change depending on the input format you are converting.

#### 4.6.2 Miscellaneous

There are a few more options in this section.

*Insert metadata as page at start of book* One of the great things about calibre is that it allows you to maintain very complete metadata about all of your books, for example, a rating, tags, comments, etc. This option will create a
single page with all this metadata and insert it into the converted e-book, typically just after the cover. Think of it as a way to create your own customised book jacket.

**Remove first image**  Sometimes, the source document you are converting includes the cover as part of the book, instead of as a separate cover. If you also specify a cover in calibre, then the converted book will have two covers. This option will simply remove the first image from the source document, thereby ensuring that the converted book has only one cover, the one specified in calibre.

### 4.7 Table of Contents

When the input document has a Table of Contents in its metadata, calibre will just use that. However, a number of older formats either do not support a metadata based Table of Contents, or individual documents do not have one. In these cases, the options in this section can help you automatically generate a Table of Contents in the converted e-book, based on the actual content in the input document.

**Note:** Using these options can be a little challenging to get exactly right. If you prefer creating/editing the Table of Contents by hand, convert to the EPUB or AZW3 formats and select the checkbox at the bottom of the Table of Contents section of the conversion dialog that says *Manually fine-tune the Table of Contents after conversion*. This will launch the ToC Editor tool after the conversion. It allows you to create entries in the Table of Contents by simply clicking the place in the book where you want the entry to point. You can also use the ToC Editor by itself, without doing a conversion. Go to Preferences→Interface→Toolbars and add the ToC Editor to the main toolbar. Then just select the book you want to edit and click the ToC Editor button.

The first option is *Force use of auto-generated Table of Contents*. By checking this option you can have calibre override any Table of Contents found in the metadata of the input document with the auto generated one.

The default way that the creation of the auto generated Table of Contents works is that, calibre will first try to add any detected chapters to the generated table of contents. You can learn how to customize the detection of chapters in the `Structure detection` (page 69) section above. If you do not want to include detected chapters in the generated table of contents, check the *Do not add detected chapters* option.

If less than the *Chapter threshold* number of chapters were detected, calibre will then add any hyperlinks it finds in the input document to the Table of Contents. This often works well many input documents include a hyperlinked Table of Contents right at the start. The *Number of links* option can be used to control this behavior. If set to zero, no links are added. If set to a number greater than zero, at most that number of links is added.

Calibre will automatically filter duplicates from the generated Table of Contents. However, if there are some additional undesirable entries, you can filter them using the *TOC Filter* option. This is a regular expression that will match the title of entries in the generated table of contents. Whenever a match is found, it will be removed. For example, to remove all entries titles “Next” or “Previous” use:

```plaintext
Next|Previous
```

The *Level 1,2,3 TOC* options allow you to create a sophisticated multi-level Table of Contents. They are XPath expressions that match tags in the intermediate XHTML produced by the conversion pipeline. See the *Introduction* (page 63) for how to get access to this XHTML. Also read the *XPath tutorial* (page 159), to learn how to construct XPath expressions. Next to each option is a button that launches a wizard to help with the creation of basic XPath expressions. The following simple example illustrates how to use these options.

Suppose you have an input document that results in XHTML that look like this:

```
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
  <title>Sample document</title>
</head>
```
Then, we set the options as:

```
Level 1 TOC : //h:h1
Level 2 TOC : //h:h2
```

This will result in an automatically generated two level Table of Contents that looks like:

```
Chapter 1
  Section 1.1
  Section 1.2
Chapter 2
  Section 2.1
```

**Warning:** Not all output formats support a multi level Table of Contents. You should first try with EPUB output. If that works, then try your format of choice.

### 4.8 Using images as chapter titles when converting HTML input documents

Suppose you want to use an image as your chapter title, but still want calibre to be able to automatically generate a Table of Contents for you from the chapter titles. Use the following HTML markup to achieve this:

```
<html>
  <body>
    <h2>Chapter 1</h2>
    <p>chapter 1 text...</p>
    <h2 title="Chapter 2"><img src="chapter2.jpg" /></h2>
    <p>chapter 2 text...</p>
  </body>
</html>
```

Set the *Level 1 TOC* setting to //h:h2. Then, for chapter two, calibre will take the title from the value of the `title` attribute on the `<h2>` tag, since the tag has no text.
4.9 Using tag attributes to supply the text for entries in the Table of Contents

If you have particularly long chapter titles and want shortened versions in the Table of Contents, you can use the title attribute to achieve this, for example:

```html
<html>
  <body>
    <h2 title="Chapter 1">Chapter 1: Some very long title</h2>
    <p>chapter 1 text...</p>
    <h2 title="Chapter 2">Chapter 2: Some other very long title</h2>
    <p>chapter 2 text...</p>
  </body>
</html>
```

Set the Level 1 TOC setting to //h:h2/@title. Then calibre will take the title from the value of the title attribute on the <h2> tags, instead of using the text inside the tag. Note the trailing /@title on the XPath expression, you can use this form to tell calibre to get the text from any attribute you like.

4.10 How options are set/saved for Conversion

There are two places where conversion options can be set in calibre. The first is in Preferences->Conversion. These settings are the defaults for the conversion options. Whenever you try to convert a new book, the settings set here will be used by default.

You can also change settings in the conversion dialog for each book conversion. When you convert a book, calibre remembers the settings you used for that book, so that if you convert it again, the saved settings for the individual book will take precedence over the defaults set in Preferences. You can restore the individual settings to defaults by using the Restore defaults button in the individual book conversion dialog. You can remove the saved settings for a group of books by selecting all the books and then clicking the Edit metadata button to bring up the bulk metadata edit dialog, near the bottom of the dialog is an option to remove stored conversion settings.

When you Bulk Convert a set of books, settings are taken in the following order (last one wins):

- From the defaults set in Preferences->Conversion
- From the saved conversion settings for each book being converted (if any). This can be turned off by the option in the top left corner of the Bulk Conversion dialog.
- From the settings set in the Bulk conversion dialog

Note that the final settings for each book in a Bulk Conversion will be saved and re-used if the book is converted again. Since the highest priority in Bulk Conversion is given to the settings in the Bulk Conversion dialog, these will override any book specific settings. So you should only bulk convert books together that need similar settings. The exceptions are metadata and input format specific settings. Since the Bulk Conversion dialog does not have settings for these two categories, they will be taken from book specific settings (if any) or the defaults.

Note: You can see the actual settings used during any conversion by clicking the rotating icon in the lower right corner and then double clicking the individual conversion job. This will bring up a conversion log that will contain the actual settings used, near the top.
4.11 Format specific tips

Here you will find tips specific to the conversion of particular formats. Options specific to particular format, whether input or output are available in the conversion dialog under their own section, for example TXT input or EPUB output.

4.11.1 Convert Microsoft Word documents

calibre can automatically convert .docx files created by Microsoft Word 2007 and newer. Just add the file to calibre and click convert (make sure you are running the latest version of calibre as support for .docx files is very new).

Note: There is a demo.docx file that demonstrates the capabilities of the calibre conversion engine. Just download it and convert it to EPUB or AZW3 to see what calibre can do.

calibre will automatically generate a Table of Contents based on headings if you mark your headings with the Heading 1, Heading 2, etc. styles in Microsoft Word. Open the output e-book in the calibre E-book viewer and click the Table of Contents button to view the generated Table of Contents.

Older .doc files

For older .doc files, you can save the document as HTML with Microsoft Word and then convert the resulting HTML file with calibre. When saving as HTML, be sure to use the “Save as Web Page, Filtered” option as this will produce clean HTML that will convert well. Note that Word produces really messy HTML, converting it can take a long time, so be patient. If you have a newer version of Word available, you can directly save it as docx as well.

Another alternative is to use the free OpenOffice. Open your .doc file in OpenOffice and save it in OpenOffice’s format .odt. calibre can directly convert .odt files.

4.11.2 Convert TXT documents

TXT documents have no well defined way to specify formatting like bold, italics, etc, or document structure like paragraphs, headings, sections and so on, but there are a variety of conventions commonly used. By default calibre attempts automatic detection of the correct formatting and markup based on those conventions.

TXT input supports a number of options to differentiate how paragraphs are detected.

Paragraph style: Auto  Analyzes the text file and attempts to automatically determine how paragraphs are defined. This option will generally work fine, if you achieve undesirable results try one of the manual options.

Paragraph style: Block  Assumes one or more blank lines are a paragraph boundary:

This is the first.
This is the second paragraph.

Paragraph style: Single  Assumes that every line is a paragraph:

This is the first.
This is the second.
This is the third.

26 https://calibre-ebook.com/downloads/demos/demo.docx
**Paragraph style: Print**  Assumes that every paragraph starts with an indent (either a tab or 2+ spaces). Paragraphs end when the next line that starts with an indent is reached:

```
This is the first.
This is the second.
This is the third.
```  

**Paragraph style: Unformatted**  Assumes that the document has no formatting, but does use hard line breaks. Punctuation and median line length are used to attempt to re-create paragraphs.

**Formatting style: Auto**  Attempts to detect the type of formatting markup being used. If no markup is used then heuristic formatting will be applied.

**Formatting style: Heuristic**  Analyzes the document for common chapter headings, scene breaks, and italicized words and applies the appropriate HTML markup during conversion.

**Formatting style: Markdown**  calibre also supports running TXT input though a transformation preprocessor known as Markdown. Markdown allows for basic formatting to be added to TXT documents, such as bold, italics, section headings, tables, lists, a Table of Contents, etc. Marking chapter headings with a leading # and setting the chapter XPath detection expression to “//h:h1” is the easiest way to have a proper table of contents generated from a TXT document. You can learn more about the Markdown syntax at daringfireball\(^{27}\).

**Formatting style: None**  Applies no special formatting to the text, the document is converted to HTML with no other changes.

### 4.11.3 Convert PDF documents

PDF documents are one of the worst formats to convert from. They are a fixed page size and text placement format. Meaning, it is very difficult to determine where one paragraph ends and another begins. calibre will try to unwrap paragraphs using a configurable, Line Un-Wrapping Factor. This is a scale used to determine the length at which a line should be unwrapped. Valid values are a decimal between 0 and 1. The default is 0.45, just under the median line length. Lower this value to include more text in the unwrapping. Increase to include less. You can adjust this value in the conversion settings under PDF Input.

Also, they often have headers and footers as part of the document that will become included with the text. Use the Search and Replace panel to remove headers and footers to mitigate this issue. If the headers and footers are not removed from the text it can throw off the paragraph unwrapping. To learn how to use the header and footer removal options, read All about using regular expressions in calibre (page 193).

Some limitations of PDF input are:

- Complex, multi-column, and image based documents are not supported.
- Extraction of vector images and tables from within the document is also not supported.
- Some PDFs use special glyphs to represent ll or ff or fi, etc. Conversion of these may or may not work depending on just how they are represented internally in the PDF.
- Links and Tables of Contents are not supported
- PDFs that use embedded non-unicode fonts to represent non-English characters will result in garbled output for those characters

\(^{27}\) https://daringfireball.net/projects/markdown/syntax
• Some PDFs are made up of photographs of the page with OCR'd text behind them. In such cases calibre uses the OCR'd text, which can be very different from what you see when you view the PDF file
• PDFs that are used to display complex text, like right to left languages and math typesetting will not convert correctly

To re-iterate PDF is a really, really bad format to use as input. If you absolutely must use PDF, then be prepared for an output ranging anywhere from decent to unusable, depending on the input PDF.

4.11.4 Comic book collections

A comic book collection is a .cbc file. A .cbc file is a ZIP file that contains other CBZ/CBR files. In addition the .cbc file must contain a simple text file called comics.txt, encoded in UTF-8. The comics.txt file must contain a list of the comics files inside the .cbc file, in the form filename:title, as shown below:

| one.cbz:Chapter One |
| two.cbz:Chapter Two |
| three.cbz:Chapter Three |

The .cbc file will then contain:

| comics.txt |
| one.cbz |
| two.cbz |
| three.cbz |

calibre will automatically convert this .cbc file into a e-book with a Table of Contents pointing to each entry in comics.txt.

4.11.5 EPUB advanced formatting demo

Various advanced formatting for EPUB files is demonstrated in this demo file. The file was created from hand coded HTML using calibre and is meant to be used as a template for your own EPUB creation efforts.

The source HTML it was created from is available demo.zip. The settings used to create the EPUB from the ZIP file are:

```
ebook-convert demo.zip .epub -vv --authors "Kovid Goyal" --language en --level-toc '/<h1>/\*[@class="title"]' --disable-font-rescaling --page-breaks-before / --no-default-epub-cover
```

Note that because this file explores the potential of EPUB, most of the advanced formatting is not going to work on readers less capable than calibre’s built-in EPUB viewer.

4.11.6 Convert ODT documents

calibre can directly convert ODT (OpenDocument Text) files. You should use styles to format your document and minimize the use of direct formatting. When inserting images into your document you need to anchor them to the paragraph, images anchored to a page will all end up in the front of the conversion.

To enable automatic detection of chapters, you need to mark them with the build-in styles called ‘Heading 1’, ‘Heading 2’, …, ‘Heading 6’ (‘Heading 1’ equates to the HTML tag <h1>, ‘Heading 2’ to <h2> etc). When you convert in calibre you can enter which style you used into the ‘Detect chapters at’ box. Example:

---

28 https://calibre-ebook.com/downloads/demos/demo.epub
29 https://calibre-ebook.com/downloads/demos/demo.zip
• If you mark Chapters with style ‘Heading 2’, you have to set the ‘Detect chapters at’ box to //h:h2

• For a nested TOC with Sections marked with ‘Heading 2’ and the Chapters marked with ‘Heading 3’ you need to enter //h:h2|//h:h3. On the Convert - TOC page set the ‘Level 1 TOC’ box to //h:h2 and the ‘Level 2 TOC’ box to //h:h3.

Well-known document properties (Title, Keywords, Description, Creator) are recognized and calibre will use the first image (not too small, and with good aspect-ratio) as the cover image.

There is also an advanced property conversion mode, which is activated by setting the custom property opf.metadata (‘Yes or No’ type) to Yes in your ODT document (File->Properties->Custom Properties). If this property is detected by calibre, the following custom properties are recognized (opf.authors overrides document creator):

<table>
<thead>
<tr>
<th>Property</th>
</tr>
</thead>
<tbody>
<tr>
<td>opf.titlesort</td>
</tr>
<tr>
<td>opf.authors</td>
</tr>
<tr>
<td>opf.authorssort</td>
</tr>
<tr>
<td>opf.publisher</td>
</tr>
<tr>
<td>opf.pubdate</td>
</tr>
<tr>
<td>opf.isbn</td>
</tr>
<tr>
<td>opf.language</td>
</tr>
<tr>
<td>opf.series</td>
</tr>
<tr>
<td>opf.seriesindex</td>
</tr>
</tbody>
</table>

In addition to this, you can specify the picture to use as the cover by naming it opf.cover (right click, Picture->Options->Name) in the ODT. If no picture with this name is found, the ‘smart’ method is used. As the cover detection might result in double covers in certain output formats, the process will remove the paragraph (only if the only content is the cover!) from the document. But this works only with the named picture!

To disable cover detection you can set the custom property opf.nocover (‘Yes or No’ type) to Yes in advanced mode.

### 4.11.7 Converting to PDF

The first, most important, setting to decide on when converting to PDF is the page size. By default, calibre uses a page size of “U.S. Letter”. You can change this to another standard page size or a completely custom size in the PDF Output section of the conversion dialog. If you are generating a PDF to be used on a specific device, you can turn on the option to use the page size from the output profile instead. So if your output profile is set to Kindle, calibre will create a PDF with page size suitable for viewing on the small kindle screen.

**Headers and Footers**

You can insert arbitrary headers and footers on each page of the PDF by specifying header and footer templates. Templates are just snippets of HTML code that get rendered in the header and footer locations. For example, to display page numbers centered at the bottom of every page, in green, use the following footer template:

```html
<p style="text-align:center; color:green">Page _PAGENUM_</p>
```

calibre will automatically replace _PAGENUM_ with the current page number. You can even put different content on even and odd pages, for example the following header template will show the title on odd pages and the author on even pages:

```html
<p style="text-align:right"><span class="even_page">_AUTHOR_</span><span class="odd_page">_TITLE_</span></p>
```

calibre will automatically replace _TITLE_ and _AUTHOR_ with the title and author of the document being converted. You can also display text at the left and right edges and change the font size, as demonstrated with this header template:
This will display the title at the left and the author at the right, in a font size smaller than the main text.

You can also use the current section in templates, as shown below:

```html
<p style="text-align:right">_SECTION_</p>
```

_SECTION_ is replaced by whatever the name of the current section is. These names are taken from the metadata Table of Contents in the document (the PDF Outline). If the document has no table of contents then it will be replaced by empty text. If a single PDF page has multiple sections, the first section on the page will be used. Similarly, there is a variable named _TOP_LEVEL_SECTION_ that can be used to get the name of the current top-level section.

You can even use javascript inside the header and footer templates, for example, the following template will cause page numbers to start at 4 instead of 1:

```html
<p id="pagenum" style="text-align:center;"></p><script>document.getElementById("pagenum").innerHTML = "" + (_PAGENUM_ + 3)</script>
```

**Note:** When adding headers and footers make sure you set the page top and bottom margins to large enough values, under the Page setup section of the conversion dialog.

### Printable Table of Contents

You can also insert a printable Table of Contents at the end of the PDF that lists the page numbers for every section. This is very useful if you intend to print out the PDF to paper. If you wish to use the PDF on an electronic device, then the PDF Outline provides this functionality and is generated by default.

You can customize the look of the generated Table of contents by using the Extra CSS conversion setting under the Look & feel part of the conversion dialog. The default css used is listed below, simply copy it and make whatever changes you like.

```css
.calibre-pdf-toc table { width: 100% }
.calibre-pdf-toc table tr td:last-of-type { text-align: right }
.calibre-pdf-toc .level-0 { font-size: larger; }
.calibre-pdf-toc .level-1 td:first-of-type { padding-left: 1.4em }
.calibre-pdf-toc .level-2 td:first-of-type { padding-left: 2.8em }
```

---

4.11. Format specific tips
calibre has an integrated e-book editor that can be used to edit books in the EPUB and AZW3 (Kindle) formats. The editor shows you the HTML and CSS that is used internally inside the book files, with a live preview that updates as you make changes. It also contains various automated tools to perform common cleanup and fixing tasks.

You can use this editor by right clicking on any book in calibre and selecting Edit book.
Contents

• Basic workflow (page 81)
• The File browser (page 83)
  – Renaming files (page 84)
  – Merging files (page 84)
  – Changing text file order (page 84)
  – Marking the cover (page 85)
  – Deleting files (page 85)
  – Exporting files (page 85)
  – Adding new images/fonts/etc. or creating new blank files (page 85)
  – Replacing files (page 85)
  – Linking stylesheets to HTML files efficiently (page 85)
• Search & replace (page 85)
  – Saved searches (page 86)
  – Function mode (page 86)
  – Search ignoring HTML tags (page 86)
• Automated tools (page 86)
  – Editing the Table of Contents (page 87)
  – Checking the Book (page 88)
  – Adding a cover (page 89)
  – Embedding referenced fonts (page 89)
  – Subsetting embedded fonts (page 89)

• Checkpoints (page 91)
• The Live preview panel (page 93)
  – Splitting HTML files (page 94)
• The Live CSS panel (page 95)
5.1 Basic workflow

Note: A video tour of the calibre editor is available here\(^{30}\).

When you first open a book with the Edit book tool, you will be presented with a list of files on the left. These are the individual HTML files, stylesheets, images, etc. that make up the content of the book. Simply double click on a file to start editing it. Note that if you want to do anything more sophisticated than making a few small tweaks, you will need to know HTML Tutorial\(^{31}\) and CSS Tutorial\(^{32}\).

As you make changes to the HTML or CSS in the editor, the changes will be previewed, live, in the preview panel to the right. When you are happy with how the changes you have made look, click the Save button or use File→Save to save your changes into the e-book.

One useful feature is Checkpoints. Before you embark on some ambitious set of edits, you can create a checkpoint. The checkpoint will preserve the current state of your book, then if in the future you decide you don’t like the changes you have made to you can go back to the state when you created the checkpoint. To create a checkpoint, use Edit→Create checkpoint. Checkpoints will also be automatically created for you whenever you run any automated tool like global search and replace. The checkpointing functionality is in addition to the normal undo/redo mechanism when editing individual files. Checkpoints are useful for when changes are spread over multiple files in the book.

That is the basic work flow for editing books – Open a file, make changes, preview and save. The rest of this manual will discuss the various tools and features present to allow you to perform specific tasks efficiently.

  - forward.png
  - image1.gif

- Fonts
  - Ubuntu - Bold.ttf
  - Ubuntu - BoldItalic.ttf
  - Ubuntu - Italic.ttf
  - Ubuntu - Regular.ttf
The **File browser** gives you an overview of the various files inside the book you are editing. The files are arranged by category, with text (HTML) files at the top, followed by stylesheet (CSS) files, images and so on. Simply double click on a file to start editing it. Editing is supported for HTML, CSS and image files. The order of text files is the same order that they would be displayed in, if you were reading the book. All other files are arranged alphabetically.

By hovering your mouse over an entry, you can see its size, and also, at the bottom of the screen, the full path to the file inside the book. Note that files inside e-books are compressed, so the size of the final book is not the sum of the individual file sizes.

Many files have special meaning, in the book. These will typically have an icon next to their names, indicating the special meaning. For example, in the picture to the left, you can see that the files `cover_image.jpg` and `titlepage.xhtml` have the icon of a cover next to them, this indicates they are the book cover image and titlepage. Similarly, the `content.opf` file has a metadata icon next to it, indicating the book metadata is present in it and the `toc.ncx` file has a T icon next to it, indicating it is the Table of Contents.

You can perform many actions on individual files, by right clicking them.

### 5.2.1 Renaming files

You can rename an individual file by right clicking it and selecting **Rename**. Renaming a file automatically updates all links and references to it throughout the book. So all you have to do is provide the new name, calibre will take care of the rest.

You can also bulk rename many files at once. This is useful if you want the files to have some simple name pattern. For example you might want to rename all the HTML files to have names Chapter-1.html, Chapter-2.html and so on. Select the files you want bulk renamed by holding down the Shift or Ctrl key and clicking the files. Then right click and select **Bulk rename**. Enter a prefix and what number you would like the automatic numbering to start at, click OK and you are done. The bulk rename dialog also lets you rename files by the order they appear in the book instead of the order you selected them in, useful, for instance to rename all images by the order they appear.

Finally, you can bulk change the file extension for all selected files. Select multiple files, as above, and right click and choose **Change the file extension for the selected files**.

### 5.2.2 Merging files

Sometimes, you may want to merge two HTML files or two CSS files together. It can sometimes be useful to have everything in a single file. Be wary, though, putting a lot of content into a single file will cause performance problems when viewing the book in a typical e-book reader.

To merge multiple files together, select them by holding the Ctrl key and clicking on them (make sure you only select files of one type, either all HTML files or all CSS files and so on). Then right click and select merge. That’s all, calibre will merge the files, automatically taking care of migrating all links and references to the merged files. Note that merging files can sometimes cause text styling to change, since the individual files could have used different stylesheets.

### 5.2.3 Changing text file order

You can re-arrange the order in which text (HTML) files are opened when reading the book by simply dragging and dropping them in the Files browser. For the technically inclined, this is called re-ordering the book spine. Note that you have to drop the items *between* other items, not on top of them, this can be a little fiddly until you get used to it.
5.2.4 Marking the cover

E-books typically have a cover image. This image is indicated in the *File browser* by the icon of a brown book next to the image name. If you want to designate some other image as the cover, you can do so by right clicking on the file and choosing *Mark as cover*.

In addition, EPUB files has the concept of a *titlepage*. A title page is a HTML file that acts as the title page/cover for the book. You can mark an HTML file as the titlepage when editing EPUBs by right-clicking. Be careful that the file you mark contains only the cover information. If it contains other content, such as the first chapter, then that content will be lost if the user ever converts the EPUB file in calibre to another format. This is because when converting, calibre assumes that the marked title page contains only the cover and no other content.

5.2.5 Deleting files

You can delete files by either right clicking on them or by selecting them and pressing the Delete key. Deleting a file removes all references to the file from the OPF file, saving you that chore. However, references in other places are not removed, you can use the Check Book tool to easily find and remove/replace them.

5.2.6 Exporting files

You can export a file from inside the book to somewhere else on your computer. This is useful if you want to work on the file in isolation, with specialised tools. To do this, simply right click on the file and choose *Export*.

Once you are done working on the exported file, you can re-import it into the book, by right clicking on the file again and choosing *Replace with file...* which will allow you to replace the file in the book with the previously exported file.

5.2.7 Adding new images/fonts/etc. or creating new blank files

You can add a new image, font, stylesheet, etc. from your computer into the book by clicking *File→New file*. This lets you either import a file by clicking the *Import resource file* button or create a new blank HTML file or stylesheet by simply entering the file name into the box for the new file.

You can also import multiple files into the book at once using File->Import files into book.

5.2.8 Replacing files

You can easily replace existing files in the book, by right clicking on the file and choosing replace. This will automatically update all links and references, in case the replacement file has a different name than the file being replaced.

5.2.9 Linking stylesheets to HTML files efficiently

As a convenience, you can select multiple HTML files in the File browser, right click and choose *Link stylesheets* to have calibre automatically insert the `<link>` tags for those stylesheets into all the selected HTML files.

5.3 Search & replace

Edit book has a very powerful search and replace interface that allows you to search and replace text in the current file, across all files and even in a marked region of the current file. You can search using a normal search or using regular
Start the search and replace via the Search→Find/replace menu entry (you must be editing an HTML or CSS file).

Type the text you want to find into the Find box and its replacement into the Replace box. You can click the appropriate buttons to Find the next match, replace the current match and replace all matches.

Using the drop downs at the bottom of the box, you can have the search operate over the current file, all text files, all style files or all files. You can also choose the search mode to be a normal (string) search or a regular expression search.

You can count all the matches for a search expression via Search→Count all. The count will run over whatever files/regions you have selected in the dropdown box.

You can also go to a specific line in the currently open editor via Search→Go to line.

Note: Remember, to harness the full power of search and replace, you will need to use regular expressions. See All about using regular expressions in calibre (page 193).

### 5.3.1 Saved searches

You can save frequently used search/replace expressions (including function mode expressions) and reuse them multiple times. To save a search simply right click in the Find box and select Save current search.

You can bring up the saved searches via Search→Saved searches. This will present you with a list of search and replace expressions that you can apply. You can even select multiple entries in the list by holding down the Ctrl Key while clicking so as to run multiple search and replace expressions in a single operation.

### 5.3.2 Function mode

Function mode allows you to write arbitrarily powerful Python functions that are run on every Find/replace. You can do pretty much any text manipulation you like in function mode. For more information, see Function mode for Search & replace in the Editor (page ??).

### 5.3.3 Search ignoring HTML tags

There is also a dedicated tool for searching for text, ignoring any HTML tags in between. For example, if the book has the HTML `<i>Empahisis on a word</i>`, you can search for `on a word` and it will be found even though there is an `<i>` tag in the middle. Use this tool via the Search→Search ignoring HTML markup menu item.

### 5.4 Automated tools

Edit book has various tools to help with common tasks. These are accessed via the Tools menu.
5.4.1 Editing the Table of Contents

There is a dedicated tool to ease editing of the Table of Contents. Launch it with Tools→Table of Contents→Edit Table of Contents.

The Edit Table of Contents tool shows you the current Table of Contents (if any) on the left. Simply double click on any entry to change its text. You can also re-arrange entries by drag and drop or by using the buttons to the right.

For books that do not have a pre-existing Table of Contents, the tool gives you various options to auto-generate a Table of Contents from the text. You can generate from the headings in the document, from links, from individual files and so on.

You can edit individual entries by clicking on them and then clicking the Change the location this entry points to button. This will open up a mini-preview of the book, simply move the mouse cursor over the book view panel, and click where you want the entry to point to. A thick green line will show you the location. Click OK once you are happy with the location.
5.4.2 Checking the Book

The *Check Book* tool searches your book for problems that could prevent it working as intended on actual reader devices. Activate it via *Tools* → *Check Book*.

Any problems found are reported in a nice, easy to use list. Clicking any entry in the list shows you some help about that error as well as giving you the option to auto-fix that error, if the error can be fixed automatically. You can also double click the error to open the location of the error in an editor, so you can fix it yourself.

Some of the checks performed are:

- Malformed HTML markup. Any HTML markup that does not parse as well-formed XML is reported. Correcting it will ensure that your markup works as intended in all contexts. calibre can also auto-fix these errors, but auto-fixing can sometimes have unexpected effects, so use with care. As always, a checkpoint is created before auto-fixing so you can easily revert all changes. Auto-fixing works by parsing the markup using the HTML5 algorithm, which is highly fault tolerant and then converting to well formed XML.
• Malformed or unknown CSS styles. Any CSS that is not valid or that has properties not defined in the CSS 2.1 standard (plus a few from CSS 3) are reported. CSS is checked in all stylesheets, inline style attributes and <style> tags in HTML files.
• Broken links. Links that point to files inside the book that are missing are reported.
• Unreferenced files. Files in the book that are not referenced by any other file or are not in the spine are reported.
• Various common problems in OPF files such as duplicate spine or manifest items, broken idrefs or meta cover tags, missing required sections and so on.
• Various compatibility checks for known problems that can cause the book to malfunction on reader devices.

5.4.3 Adding a cover

You can easily add a cover to the book via Tools→Add cover. This allows you to either choose an existing image in the book as the cover or import a new image into the book and make it the cover. When editing EPUB files, the HTML wrapper for the cover is automatically generated. If an existing cover in the book is found, it is replaced. The tool also automatically takes care of correctly marking the cover files as covers in the OPF.

5.4.4 Embedding referenced fonts

Accessed via Tools→Embed reference fonts, this tool finds all fonts referenced in the book and if they are not already embedded, searches your computer for them and embeds them into the book, if found. Please make sure that you have the necessary copyrights for embedding commercially licensed fonts, before doing this.

5.4.5 Subsetting embedded fonts

Accessed via Tools→Subset embedded fonts, this tool reduces all the fonts in the book to only contain glyphs for the text actually present in the book. This commonly reduces the size of the font files by ~ 50%. However, be aware that once the fonts are subset, if you add new text whose characters are not previously present in the subset font, the font will not work for the new text. So do this only as the last step in your workflow.

5.4.6 Smartening punctuation

Convert plain text dashes, ellipsis, quotes, multiple hyphens, etc. into their typographically correct equivalents. Note that the algorithm can sometimes generate incorrect results, especially when single quotes at the start of contractions are involved. Accessed via Tools→Smarten punctuation.

5.4.7 Transforming CSS properties

Create rules to transform the styling of the book. For example, create a rule to convert all red text to green or to double the font size of all text in the book or make text of a certain font family italic, etc.

Creating the rules is simple, the rules follow a natural language format, that looks like:

• If the property color is red change it to green
• If the property font-size is any value multiply the value by 2

Accessed via Tools→Transform styles.
5.4.8 Removing unused CSS rules

Remove all unused CSS rules from stylesheets and <style> tags. Some books created from production templates can have a large number of extra CSS rules that don’t match any actual content. These extra rules can slow down readers that need to process them all. Accessed via Tools→Remove unused CSS.

5.4.9 Fixing HTML

This tool simply converts HTML that cannot be parsed as XML into well-formed XML. It is very common in e-books to have non-well-formed XML, so this tool simply automates the process of fixing such HTML. The tool works by parsing the HTML using the HTML5 algorithm (the algorithm used in all modern browsers) and then converting the result into XML. Be aware that auto-fixing can sometimes have counter-intuitive results. If you prefer, you can use the Check Book tool discussed above to find and manually correct problems in the HTML. Accessed via Tools→Fix HTML.

5.4.10 Beautifying files

This tool is used to auto-format all HTML and CSS files so that they “look pretty”. The code is auto-indented so that it lines up nicely, blank lines are inserted where appropriate and so on. Note that beautifying also auto-fixes broken HTML/CSS. Therefore, if you don’t want any auto-fixing to be performed, first use the Check Book tool to correct all problems and only then run beautify. Accessed via Tools→Beautify all files.

Note: In HTML any text can have significant whitespace, via the CSS white-space directive. Therefore, beautification could potentially change the rendering of the HTML. To avoid this as far as possible, the beautify algorithm only beautifies block level tags that contain other block level tags. So, for example, text inside a <p> tag will not have its whitespace changed. But a <body> tag that contains only other <p> and <div> tags will be beautified. This can sometimes mean that a particular file will not be affected by beautify as it has no suitable block level tags. In such cases you can try different beautification tools, that are less careful, for example: HTML Tidy

33 https://infohound.net/tidy/

5.4.11 Inserting an inline Table of Contents

Normally in e-books, the Table of Contents is separate from the main text and is typically accessed via a special Table of Contents button/menu in the e-book reading device. You can also have calibre automatically generate an inline Table of Contents that becomes part of the text of the book. It is generated based on the currently defined Table of Contents.

If you use this tool multiple times, each invocation will cause the previously created inline Table of Contents to be replaced. The tool can be accessed via Tools→Table of Contents→Insert inline Table of Contents.

5.4.12 Setting Semantics

This tool is used to set semantics in EPUB files. Semantics are simply, links in the OPF file that identify certain locations in the book as having special meaning. You can use them to identify the foreword, dedication, cover, table of contents, etc. Simply choose the type of semantic information you want to specify and then select the location in the book the link should point to. This tool can be accessed via Tools→Set semantics.
5.4.13 Filtering style information

This tool can be used to easily remove specified CSS style properties from the entire book. You can tell it what properties you want removed, for example, color, background-color, line-height and it will remove them from everywhere they occur — stylesheets, <style> tags and inline style attributes. After removing the style information, a summary of all the changes made is displayed so you can see exactly what was changed. The tool can be accessed via Tools→Filter style information.

5.4.14 Upgrading the book’s internals

This tool can be used to upgrade the book’s internals, if possible. For instance it will upgrade EPUB 2 books to EPUB 3 books. The tool can be accessed via Upgrade book internals.

5.5 Checkpoints

Checkpoints are a way to mark the current state of the book as “special”. You can then go on to do whatever changes you want to the book and if you don’t like the results, return to the checkpointed state. Checkpoints are automatically created every time you run any of the automated tools described in the previous section.

You can create a checkpoint via Edit→Create checkpoint. And go back to a previous checkpoint with Edit→Revert to ...

The checkpointing functionality is in addition to the normal Undo/redo mechanism when editing individual files. Checkpoints are particularly useful for when changes are spread over multiple files in the book or when you wish to be able to revert a large group of related changes as a whole.

You can see a list of available checkpoints via View→Checkpoints. You can compare the current state of the book to a specified checkpoint using the Comparing e-books (page 121) tool – by selecting the checkpoint of interest and clicking the Compare button. The Revert to button restores the book to the selected checkpoint, undoing all changes since that checkpoint was created.
5.6 The Live preview panel

**Inline formatting**

Here, we demonstrate various types of inline text formatting and the use of embedded fonts.

Here is some **bold**, *italic*, **bold-italic**, underlined and struck-out text. Then, we have a superscript and a subscript. Now we see some **red**, **green** and **blue** text. Some text with a yellow highlight. Some text in a box. Some text in inverse video.

A paragraph with styled text: *subtle emphasis* followed by **strong text** and **intense emphasis**. This paragraph uses document wide styles for styling rather than inline text properties as demonstrated in the previous paragraph — calibre can handle both with equal ease.

**Fun with fonts**

This document has embedded the Ubuntu font family. The body text is in the Ubuntu typeface, here is some text in the Ubuntu Mono typeface, notice how every letter has the same width, even `i` and `m`. Every embedded font will automatically be embedded in the output ebook during conversion.
The *File preview* gives you an overview of the various files inside. The live preview panel shows you the changes you are making live (with a second or two of delay). As you edit HTML or CSS files, the preview panel is updated automatically to reflect your changes. As you move the cursor around in the editor, the preview panel will track its location, showing you the corresponding location in the book. Clicking in the preview panel, will cause the cursor in the editor to be positioned over the element you clicked. If you click a link pointing to another file in the book, that file will be opened in the edit and the preview panel, automatically.

You can turn off the automatic syncing of position and live preview of changes – by buttons under the preview panel. The live update of the preview panel only happens when you are not actively typing in the editor, so as not to be distracting or slow you down, waiting for the preview to render.

The preview panel shows you how the text will look when viewed. However, the preview panel is not a substitute for actually testing your book an actual reader device. It is both more, and less capable than an actual reader. It will tolerate errors and sloppy markup much better than most reader devices. It will also not show you page margins, page breaks and embedded fonts that use font name aliasing. Use the preview panel while you are working on the book, but once you are done, review it in an actual reader device or software emulator.

**Note:** The preview panel does not support embedded fonts if the name of the font inside the font file does not match the name in the CSS `@font-face` rule. You can use the Check Book tool to quickly find and fix any such problem fonts.

### 5.6.1 Splitting HTML files

One, perhaps non-obvious, use of the preview panel is to split long HTML files. While viewing the file you want to split, click the *split mode* button under the preview panel. Then simply move your mouse to the place where you want to split the file and click. A thick green line will show you exactly where the split will happen as you move your mouse. Once you have found the location you want, simply click and the split will be performed.

Splitting the file will automatically update all links and references that pointed into the bottom half of the file and will open the newly split file in an editor.

You can also split a single HTML file at multiple locations automatically, by right clicking inside the file in the editor and choosing *Split at multiple locations*. This will allow you to easily split a large file at all heading tags or all tags having a certain class and so on.
5.7 The Live CSS panel

The Live CSS panel shows you all the style rules that apply to the tag you are currently editing. The name of tag, along with its line number in the editor are displayed, followed by a list of matching style rules.

It is a great way to quickly see which style rules apply to any tag. The view also has clickable links (in blue), which take you directly to the location where the style was defined, in case you wish to make any changes to the style rules. Style rules that apply directly to the tag, as well as rules that are inherited from parent tags are shown.

The panel also shows you what the finally calculated styles for the tag are. Properties in the list that are superseded by higher priority rules are shown with a line through them.

You can enable the Live CSS panel via View→Live CSS.
5.8 Miscellaneous tools

There are a few more tools that can be useful while you edit the book.

5.8.1 The Table of Contents view

The Table of Contents view shows you the current table of contents in the book. Double clicking on any entry opens the place that entry points to in an editor. You can right click to edit the Table of Contents, refresh the view or expand/collapse all items. Access this view via View→Table of Contents.

5.8.2 Checking the spelling of words in the book

You can run a spelling checker via Tools→Check spelling.
Words are shown with the number of times they occur in the book and the language the word belongs to. Language information is taken from the books metadata and from `lang` attributes in the HTML files. This allows the spell checker to work well even with books that contain text in multiple languages. For example, in the following HTML extract, the word `color` will be checked using American English and the word `colour` using British English:

```html
<div lang="en_US">color <span lang="en_GB">colour</span></div>
```

**Note:** You can double click a word to highlight the next occurrence of that word in the editor. This is useful if you wish to manually edit the word, or see what context it is in.

To change a word, simply double click one of the suggested alternative spellings on the right, or type in your own corrected spelling and click the *Change selected word to* button. This will replace all occurrences of the word in the book. You can also right click on a word in the main word list to change the word conveniently from the right click.

### 5.8. Miscellaneous tools

97
menu.

You can have the spelling checker ignore a word for the current session by clicking the Ignore button. You can also add a word to the user dictionary by clicking the Add to dictionary button. The spelling checker supports multiple user dictionaries, so you can select the dictionary you want the word added to.

You can also have the spelling checker display all the words in your book, not just the incorrectly spelled ones. This is useful to see what words are most common in your book and to run a simple search and replace on individual words.

**Note:** If you make any changes to the book by editing files while the spell check tool is open, you should click the Refresh button in the spell check tool. If you do not do this and continue to use the spell check tool, you could lose the changes you have made in the editor.

---

### Adding new dictionaries

The spelling checker comes with built-in dictionaries for the English and Spanish languages. You can install your own dictionaries via Preferences → Editor → Manage spelling dictionaries. The spell checker can use dictionaries from the LibreOffice program (in the .oxt format). You can download these dictionaries from The LibreOffice Extensions repository.

---

### 5.8.3 Inserting special characters

You can insert characters that are difficult to type by using the Edit → Insert special character tool. This shows you all unicode characters, simply click on the character you want to type. If you hold Ctrl while clicking, the window will close itself after inserting the selected character. This tool can be used to insert special characters into the main text or into any other area of the user interface, such as the Search and replace tool.

Because there are a lot of characters, you can define your own Favorite characters, that will be shown first. Simply right click on a character to mark it as favorite. You can also right click on a character in favorites to remove it from favorites. Finally, you can re-arrange the order of characters in favorites by clicking the Re-arrange favorites button and then drag and dropping the characters in favorites around.

You can also directly type in special characters using the keyboard. To do this, you type the unicode code for the character (in hexadecimal) and then press the Alt+X key which will convert the previously typed code into the corresponding character. For example, to type Ÿ you would type ff and then Alt+X. To type a non-breaking space you would use a0 and then Alt+X, to type the horizontal ellipsis you would use 2026 and Alt+X and so on.

Finally, you can type in special characters by using HTML named entities. For example, typing &nbsp; will be replaced by a non-breaking space when you type the semi-colon. The replacement happens only when typing the semi-colon.

---

### 5.8.4 The code inspector view

This view shows you the HTML coding and CSS that applies to the current element of interest. You open it by right clicking a location in the preview panel and choosing Inspect. It allows you to see the HTML coding for that element and more importantly, the CSS styles that apply to it. You can even dynamically edit the styles and see what effect your changes have instantly. Note that editing the styles does not actually make changes to the book contents, it only allows for quick experimentation. The ability to live edit inside the Inspector is under development.

---

34 https://extensions.libreoffice.org/extension-center?getCategories=Dictionary&getCompatibility=any&sort_on=positive_ratings
5.8.5 Checking external links

You can use this tool to check all links in your book that point to external websites. The tool will try to visit every externally linked website, and if the visit fails, it will report all broken links in a convenient format for you to fix.

5.8.6 Downloading external resources

You can use this tool to automatically download any images/stylesheets/etc. in the book that are not bundled with the book (i.e. they have URLs pointing to a location on the internet). The tool will find all such resources and automatically download them, add them to the book and replace all references to them to use the downloaded files.

5.8.7 Arranging files into folders by type

Often when editing EPUB files that you get from somewhere, you will find that the files inside the EPUB are arranged haphazardly, in different sub-folders. This tool allows you to automatically move all files into sub-folders based on their types. Access it via Tools→Arrange into folders. Note that this tool only changes how the files are arranged inside the EPUB, it does not change how they are displayed in the File browser.

5.8.8 Importing files in other e-book formats as EPUB

The editor includes the ability to import files in some other e-book formats directly as a new EPUB, without going through a full conversion. This is particularly useful to directly create EPUB files from your own hand-edited HTML files. You can do this via File→Import an HTML or DOCX file as a new book.

Function mode for Search & replace in the Editor

The Search & replace tool in the editor support a function mode. In this mode, you can combine regular expressions (see All about using regular expressions in calibre (page ??)) with arbitrarily powerful Python functions to do all sorts of advanced text processing.

In the standard regexp mode for search and replace, you specify both a regular expression to search for as well as a template that is used to replace all found matches. In function mode, instead of using a fixed template, you specify an arbitrary function, in the Python programming language\(^{35}\). This allows you to do lots of things that are not possible with simple templates.

Techniques for using function mode and the syntax will be described by means of examples, showing you how to create functions to perform progressively more complex tasks.

Automatically fixing the case of headings in the document

Here, we will leverage one of the built-in functions in the editor to automatically change the case of all text inside heading tags to title case:

\[^{35}\] https://docs.python.org/2.7/
Find expression: <((Hh)[l-6])[^>]*>.+?</\1>

For the function, simply choose the Title-case text (ignore tags) builtin function. The will change titles that look like:

\(<h1>some TITLE</h1>\) to \(<h1>Some Title</h1>\). It will work even if there are other HTML tags inside the heading tags.

**Your first custom function - smartening hyphens**

The real power of function mode comes from being able to create your own functions to process text in arbitrary ways. The Smarten Punctuation tool in the editor leaves individual hyphens alone, so you can use this function to replace them with em-dashes.

To create a new function, simply click the Create/edit button to create a new function and copy the Python code from below.

```python
def replace(match, number, file_name, metadata, dictionaries, data, functions, *args, **kwargs):
    return match.group().replace('--', '--').replace('-', '--')
```

Every Search & replace custom function must have a unique name and consist of a Python function named replace, that accepts all the arguments shown above. For the moment, we won't worry about all the different arguments to replace() function. Just focus on the match argument. It represents a match when running a search and replace. Its full documentation is available here\(^\text{36}\). match.group() simply returns all the matched text and all we do is replace hyphens in that text with em-dashes, first replacing double hyphens and then single hyphens.

Use this function with the find regular expression:

\(\^[^<>]+<\)

And it will replace all hyphens with em-dashes, but only in actual text and not inside HTML tag definitions.

**The power of function mode - using a spelling dictionary to fix mis-hyphenated words**

Often, e-books created from scans of printed books contain mis-hyphenated words – words that were split at the end of the line on the printed page. We will write a simple function to automatically find and fix such words.

```python
import regex
from calibre import replace_entities
from calibre import prepare_string_for_xml

def replace(match, number, file_name, metadata, dictionaries, data, functions, *args, **kwargs):
    
    def replace_word(wmatch):
        # Try to remove the hyphen and replace the words if the resulting
        # hyphen free word is recognized by the dictionary
        without_hyphen = wmatch.group(1) + wmatch.group(2)
        if dictionaries.recognized(without_hyphen):
            return without_hyphen
        return wmatch.group()

    # Search for words split by a hyphen
```

\(^\text{36}\) https://docs.python.org/2.7/library/re.html#match-objects
text = replace_entities(match.group()[1:-1])  # Handle HTML entities like &amp;
corrected = regex.sub(r'(^\w+\s*\s*(\w+)', replace_word, text, flags=regex.VERSION1 | regex.UNICODE)
return '>%s' % prepare_string_for_xml(corrected)  # Put back required entities

Use this function with the same find expression as before, namely:

>[^<>]+<

And it will magically fix all mis-hyphenated words in the text of the book. The main trick is to use one of the useful extra arguments to the replace function, dictionaries. This refers to the dictionaries the editor itself uses to spell check text in the book. What this function does is look for words separated by a hyphen, remove the hyphen and check if the dictionary recognizes the composite word, if it does, the original words are replaced by the hyphen free composite word.

Note that one limitation of this technique is it will only work for mono-lingual books, because, by default, dictionaries.recognized() uses the main language of the book.

Auto numbering sections

Now we will see something a little different. Suppose your HTML file has many sections, each with a heading in an <h2> tag that looks like <h2>Some text</h2>. You can create a custom function that will automatically number these headings with consecutive section numbers, so that they look like <h2>1. Some text</h2>.

```python
def replace(match, number, file_name, metadata, dictionaries, data, functions, *args, **kwargs):
    section_number = '%d. ' % number
    return match.group(1) + section_number + match.group(2)
```

Use it with the find expression:

```regex
(?s)(<h2[^<>]*>)(.+?</h2>)
```

Place the cursor at the top of the file and click Replace all.

This function uses another of the useful extra arguments to replace(): the number argument. When doing a Replace All number is automatically incremented for every successive match.

Another new feature is the use of replace.file_order – setting that to 'spine' means that if this search is run on multiple HTML files, the files are processed in the order in which they appear in the book. See Choose file order when running on multiple HTML files (page 105) for details.

Auto create a Table of Contents

Finally, lets try something a little more ambitious. Suppose your book has headings in h1 and h2 tags that look like <h1 id="someid">Some Text</h1>. We will auto-generate an HTML Table of Contents based on these headings. Create the custom function below:
```python
from calibre import replace_entities
from calibre.ebooks.oeb.polish.toc import TOC, toc_to_html
from calibre.gui2.tweak_book import current_container
from calibre.ebooks.oeb.base import xml2str

def replace(match, number, file_name, metadata, dictionaries, data, functions, *args, **kwargs):
    if match is None:
        # All matches found, output the resulting Table of Contents.
        # The argument metadata is the metadata of the book being edited
        if 'toc' in data:
            toc = data['toc']
            root = TOC()
            for (file_name, tag_name, anchor, text) in toc:
                parent = root.children[-1] if tag_name == 'h2' and root.children else root
                parent.add(text, file_name, anchor)
            toc = toc_to_html(root, current_container(), 'toc.html', 'Table of Contents for ' + metadata.title, metadata.language)
            print(xml2str(toc))
        else:
            print('No headings to build ToC from found')
    else:
        # Add an entry corresponding to this match to the Table of Contents
        if 'toc' not in data:
            # The entries are stored in the data object, which will persist
            # for all invocations of this function during a 'Replace All' operation
            data['toc'] = []
            tag_name, anchor, text = match.group(1), replace_entities(match.group(2)), replace_entities(match.group(3))
            data['toc'].append((file_name, tag_name, anchor, text))
        return match.group()  # We don't want to make any actual changes, so return
        # the original matched text

    # Ensure that we are called once after the last match is found so we can
    # output the ToC
    replace.call_after_last_match = True
    # Ensure that when running over multiple files, this function is called,
    # the files are processed in the order in which they appear in the book
    replace.file_order = 'spine'
```

And use it with the find expression:

```html
<h[12]] [^<>]+ id=['"]{[^'""]+}|[^'""][^<>]+>[^<>]+</h[12]>+}
```

Run the search on All text files and at the end of the search, a window will popup with “Debug output from your function” which will have the HTML Table of Contents, ready to be pasted into toc.html.

The function above is heavily commented, so it should be easy to follow. The key new feature is the use of another useful extra argument to the replace() function, the data object. The data object is a Python dict that persists between all successive invocations of replace() during a single Replace All operation.

Another new feature is the use of call_after_last_match – setting that to True on the replace() function means that the editor will call replace() one extra time after all matches have been found. For this extra call, the match object will be None.

This was just a demonstration to show you the power of function mode, if you really needed to generate a Table of Contents from headings in your book, you would be better off using the dedicated Table of Contents tool in Tools → Table
The API for the function mode

All function mode functions must be Python functions named `replace`, with the following signature:

```python
def replace(match, number, file_name, metadata, dictionaries, data, functions, *args, **kwargs):
    return a_string
```

When a find/replace is run, for every match that is found, the `replace()` function will be called, it must return the replacement string for that match. If no replacements are to be done, it should return `match.group()` which is the original string. The various arguments to the `replace()` function are documented below.

The `match` argument

The `match` argument represents the currently found match. It is a Python Match object\[37\]. Its most useful method is `group()` which can be used to get the matched text corresponding to individual capture groups in the search regular expression.

The `number` argument

The `number` argument is the number of the current match. When you run Replace All, every successive match will cause `replace()` to be called with an increasing number. The first match has number 1.

The `file_name` argument

This is the filename of the file in which the current match was found. When searching inside marked text, the `file_name` is empty. The `file_name` is in canonical form, a path relative to the root of the book, using `/` as the path separator.

The `metadata` argument

This represents the metadata of the current book, such as title, authors, language, etc. It is an object of class `calibre.ebooks.metadata.book.base.Metadata` (page 185). Useful attributes include, `title`, `authors` (a list of authors) and `language` (the language code).

The `dictionaries` argument

This represents the collection of dictionaries used for spell checking the current book. Its most useful method is `dictionaries.recognized(word)` which will return `True` if the passed in word is recognized by the dictionary for the current book’s language.

---

37 https://docs.python.org/2.7/library/re.html#match-objects
The \texttt{data} argument

This a simple Python \texttt{dict}. When you run \textit{Replace all}, every successive match will cause \texttt{replace()} to be called with the same \texttt{dict} as data. You can thus use it to store arbitrary data between invocations of \texttt{replace()} during a \textit{Replace all} operation.

The \texttt{functions} argument

The \texttt{functions} argument gives you access to all other user defined functions. This is useful for code re-use. You can define utility functions in one place and re-use them in all your other functions. For example, suppose you create a function name \texttt{My Function} like this:

\begin{verbatim}
def utility():
    # do something
def replace(match, number, file_name, metadata, dictionaries, data, functions, *args, **kwargs):
    ...
\end{verbatim}

Then, in another function, you can access the \texttt{utility()} function like this:

\begin{verbatim}
def replace(match, number, file_name, metadata, dictionaries, data, functions, *args, **kwargs):
    utility = functions['My Function']['utility']
    ...
\end{verbatim}

You can also use the \texttt{functions} object to store persistent data, that can be re-used by other functions. For example, you could have one function that when run with \textit{Replace All} collects some data and another function that uses it when it is run afterwards. Consider the following two functions:

\begin{verbatim}
# Function One
persistent_data = {}
def replace(match, number, file_name, metadata, dictionaries, data, functions, *args, **kwargs):
    ...
persistent_data['something'] = 'some data'

# Function Two
def replace(match, number, file_name, metadata, dictionaries, data, functions, *args, **kwargs):
    persistent_data = functions['Function One']['persistent_data']
    ...
\end{verbatim}

Debugging your functions

You can debug the functions you create by using the standard \texttt{print()} function from Python. The output of print will be displayed in a popup window after the Find/replace has completed. You saw an example of using \texttt{print()} to output an entire table of contents above.
Choose file order when running on multiple HTML files

When you run a Replace all on multiple HTML files, the order in which the files are processed depends on what files you have open for editing. You can force the search to process files in the order in which they appear by setting the file_order attribute on your function, like this:

```python
def replace(match, number, file_name, metadata, dictionaries, data, functions, *args, **kwargs):
    ...
replace.file_order = 'spine'
```

file_order accepts two values, spine and spine-reverse which cause the search to process multiple files in the order they appear in the book, either forwards or backwards, respectively.

Having your function called an extra time after the last match is found

Sometimes, as in the auto generate table of contents example above, it is useful to have your function called an extra time after the last match is found. You can do this by setting the call_after_last_match attribute on your function, like this:

```python
def replace(match, number, file_name, metadata, dictionaries, data, functions, *args, **kwargs):
    ...
replace.call_after_last_match = True
```

Appending the output from the function to marked text

When running search and replace on marked text, it is sometimes useful to append so text to the end of the marked text. You can do this by setting the append_final_output_to_marked attribute on your function (note that you also need to set call_after_last_match), like this:

```python
def replace(match, number, file_name, metadata, dictionaries, data, functions, *args, **kwargs):
    ...
    return 'some text to append'
replace.call_after_last_match = True
replace.append_final_output_to_marked = True
```

Suppressing the result dialog when performing searches on marked text

You can also suppress the result dialog (which can slow down the repeated application of a search/replace on many blocks of text) by setting the suppress_result_dialog attribute on your function, like this:

```python
def replace(match, number, file_name, metadata, dictionaries, data, functions, *args, **kwargs):
    ...
replace.suppress_result_dialog = True
```
More examples

More useful examples, contributed by calibre users, can be found in the calibre Editor forum.

Snippets

The calibre editor supports snippets. A snippet is a piece of text that is either re-used often or contains a lot of redundant text. The editor allows you to insert a snippet with only a few key strokes. For example, suppose you often find yourself inserting link tags when editing HTML files, then you can simply type `<a` in the editor and press Control+J. The editor will expand it to:

```
<a href="filename"></a>
```

Not only that, the word `filename` will be selected, with the cursor placed over it, so that you can easily type in the real filename, using the editor’s nifty Auto-complete (page 110) feature. And once you are done typing the filename, press Control+J again and the cursor will jump to the position in between the `<a>` tags so you can easily type in the text for the link.

The snippets system in the editor is very sophisticated, there are a few built-in snippets and you can create your own to suit your editing style.

The following discussion of the built-in snippets should help illustrate the power of the snippets system.

**Note:** You can also use snippets in the text entry fields in the Search & replace panel, however, placeholders (using Control+J to jump around) will not work.

The built-in snippets

The built-in snippets are described below. Note that you can override them by creating your own snippets with the same trigger text.

**Inserting filler text [Lorem]**

The first built-in snippet, and the simplest is used to insert filler text into a document. The filler text is taken from *De finibus bonorum et malorum* a philosophical work by Cicero (translated to English). To use it simply type `Lorem` in an HTML file and press Control+J. It will be replaced by a couple of paragraphs of filler.

The definition of this snippet is very simple, the trigger text is defined as `Lorem` and the template is defined simply as the literal text to be inserted. You can easily customize it to use your favorite form of filler text.

**Inserting a self-closing HTML tag [<>]**

Now let’s look at a simple example of the powerful concept of placeholders. Say you want to insert the self-closing tag `<hr/>`. Just type `<>`, and press Control+J, the editor will expand the snippet to:

```
<\/>
```
Here, the symbol represents the current cursor position. You can then type \texttt{hr} and press Control+J to move the cursor to after the end of the tag. This snippet is defined as:

| Trigger: <> |
| Template: <$1/>$2 |

Placeholders are simply the dollar ($) sign followed by a number. When the snippet is expanded by pressing Control+J the cursor is positioned at the first placeholder (the placeholder with the lowest number). When you press Control+J again the cursor jumps to the next placeholder (the placeholder with the next higher number).

### Inserting an HTML link [\texttt{<a}]

HTML link tags all share a common structure. They have an \texttt{href} attribute and some text between the opening and closing tags. A snippet to make typing them more efficient will introduce us to some more features of placeholders. To use this snippet, simply type \texttt{<a} and press Control+J. The editor will expand this to:

```html
<a href="filename"></a>
```

Not only that, the word \texttt{filename} will be selected, with the cursor placed over it, so that you can easily type in the real filename, using the editor’s nifty \textit{Auto-complete} (page 110) feature. And once you are done typing the filename, press Control+J again and the cursor will jump to the position in between the \texttt{<a>} tags so you can easily type in the text for the link. After you are done typing the text, press Control+J again to jump to the point after the closing tag. This snippet is defined as:

| Trigger: <a |
| Template: <a href="${1:filename}">${2*}</a>$3 |

There are a couple of new features here. First the $1 placeholder has become more complex. It now includes some \textit{default text} (the word \texttt{filename}). If a placeholder contains default text, the default text is substituted for the placeholder when the snippet is expanded. Also when you jump to a placeholder with default text using Control+J, the default text is selected. In this way, you can use default text to act as a reminder to you to fill in important parts of the template. You can specify default text for a placeholder by using the syntax: \texttt{$<\text{number}>:default text}.

The other new feature is that the second placeholder has an asterisk after it (${2*}$). This means that any text that was selected before expanding the template is substituted for the placeholder. To see this in action, select some text in the editor, press Control+J, type \texttt{<a} and press Control+J again, the template will be expanded to:

```html
<a href="filename">whatever text you selected</a>
```

### Inserting a HTML image tag [\texttt{<i}]

This is very similar to inserting an HTML link, as we saw above. It allows you to quickly input an \texttt{<img src="filename" alt="description" />} tag and jump between the \texttt{src} and \texttt{alt} attributes:

| Trigger: <i |
| Template: <img src="${1:filename}" alt="${2*:description}" />$3 |

### Insert an arbitrary HTML tag [\texttt{<<}]

This allows you to insert an arbitrary full HTML tag (or wrap previously selected text in the tag). To use it, simply type \texttt{<<} and press Control+J. The editor will expand it to:
Type the tag name, for example: \texttt{span} and press \texttt{Control+J}, that will result in:

\begin{verbatim}
<\texttt{span}>|</\texttt{span}>
\end{verbatim}

You will note that the closing tag has been automatically filled with \texttt{span}. This is achieved with yet another feature of placeholders, \textit{mirroring}. Mirroring simply means that if you specify the sample placeholder more than once in a template, the second and all later positions will be automatically filled in with whatever you type in the first position, when you press \texttt{Control+J}. The definition for this snippet is:

\begin{verbatim}
Trigger: <<
Template: <$1>${2*}</$1>$3
\end{verbatim}

As you can see, the first placeholder ($1$) has been specified twice, the second time in the closing tag, which will simply copy whatever you type in the opening tag.

\textbf{Inserting an arbitrary HTML tag with a class attribute [\texttt{<c}]}

This is very similar to the insert arbitrary tag example above, except that it assumes that you want to specify a class for the tag:

\begin{verbatim}
Trigger: <<
Template: <$1$\texttt{class="${2:classname}"}$3</$1>$4
\end{verbatim}

This will allow you to first type the tag name, press \texttt{Control+J}, type the class name, press \texttt{Control+J} type the contents of the tag and press \texttt{Control+J} one last time to jump out of the tag. The closing tag will be auto-filled.

\textbf{Creating your own snippets}

Snippets really shine because you can create your own to suit your editing style. To create your own snippets go to \texttt{Edit}→\texttt{Preferences}→\texttt{Editor settings}→\texttt{Manage snippets} in the editor. This will pop-up an easy to use dialog to help you create your own snippets. Simply click the \texttt{Add snippet} button and you will see a dialog that looks like:
First give your snippet a name, something descriptive, to help identify the snippet in the future. Then specify the trigger. A trigger is simply the text that you have to type in the editor before pressing Control+J in order to expand the snippet.

Then specify the snippet template. You should start with one of the example above and modify it to suit your needs. Finally, specify which file types you want the snippet to be active for. This way you can have multiple snippets with the same trigger text that work differently in different file types.

The next step is to test your newly created snippet. Use the Test box at the bottom. Type in the trigger text and press Control+J to expand the snippet and jump between placeholders.

### 5.8.9 The Reports tool

The editor includes a nice Reports tool (via Tools→Reports) that shows summaries of the files, images, links, words, characters and styles used in the book. Every line in the report is hot-linked. Double clicking a line jumps to the place in the book where that item is used or defined (as appropriate). For example, in the Links view, you can double click entries the Source column to jump to where the link is defined and entries in the Target column to jump to where the link points.
5.9 Special features in the code editor

The calibre HTML editor is very powerful. It has many features that make editing of HTML (and CSS) easier.

5.9.1 Syntax highlighting

The HTML editor has very sophisticated syntax highlighting. Features include:

- The text inside bold, italic and heading tags is made bold/italic
- As you move your cursor through the HTML, the matching HTML tags are highlighted, and you can jump to the opening or closing tag with the keyboard shortcuts Ctrl+{ and Ctrl+}
- Invalid HTML is highlighted with a red underline
- Spelling errors in the text inside HTML tags and attributes such as title are highlighted. The spell checking is language aware, based on the value of the lang attribute of the current tag and the overall book language.
- CSS embedded inside `<style>` tags is highlighted
- Special characters that can be hard to distinguish such as non-breaking spaces, different types of hyphens, etc. are highlighted.
- Links to other files in `<a>`, `<img>` and `<link>` tags all have the filenames highlighted. If the filename they point to does not exist, the filename is marked with a red underline.

5.9.2 Context sensitive help

You can right click on an HTML tag name or a CSS property name to get help for that tag or property.

You can also hold down the Ctrl key and click on any filename inside a link tag to open that file in the editor automatically.

5.9.3 Auto-complete

When editing an e-book, one of the most tedious tasks is creating links to other files inside the book, or to CSS stylesheets, or images. You have to figure out the correct filename and relative path to the file. The editor has auto-complete to make that easier.
As you type a filename, the editor automatically pops up suggestions. Simply use the Tab key to select the correct file name. The editor even offers suggestions for links pointing to an anchor inside another HTML file. After you type the # character, the editor will show you a list of all anchors in the target file, with a small snippet of text to help you choose the right anchor.

Note that unlike most other completion systems, the editor’s completion system uses subsequence matching. This means that you can type just two or three letters from anywhere in the filename to complete the filename. For example, say you want the filename ../_images/arrow1.png, you can simply type ial and press Tab to complete the filename. When searching for matches, the completion system prioritizes letters that are at the start of a word, or immediately after a path separator. Once you get used to this system, you will find it saves you a lot of time and effort.

5.9.4 Snippets

The calibre editor supports snippets. A snippet is a piece of text that is either re-used often or contains a lot of redundant text. The editor allows you to insert a snippet with only a few key strokes. The snippets are very powerful, with many features, such as placeholders you can jump between, automatic mirroring of repeated text and so on. For more information, see Snippets (page ??).
The calibre Content server allows you to access your calibre libraries and read books directly in a browser on your favorite mobile phone or tablet device. As a result, you do not need to install any dedicated book reading/management apps on your phone. Just use the browser. The server downloads and stores the book you are reading in an off-line cache so that you can read it even when there is no internet connection.

Contents

- Accessing the Content server from other devices (page 114)
  - Accessing the server from devices on your home network (page 114)
  - Accessing the server from anywhere on the internet (page 115)
- The server interface (page 115)
  - The book list (page 115)
  - The book reader (page 116)
- Browser support (page 116)
- Managing user accounts from the command-line only (page 116)
- Integrating the calibre Content server into other servers (page 117)
  - Using a full virtual host (page 117)
  - Using a URL prefix (page 117)
- Creating a service for the calibre server on a modern Linux system (page 118)

To start the server, click the Connect/share button and choose Start Content server. You might get a message from your computer’s firewall or anti-virus program asking if it is OK to allow access to calibre.exe. Click the Allow or OK button. Then open a browser (preferably Chrome or Firefox) in your computer and type in the following address:

http://127.0.0.1:8080
This will open a page in the browser showing you your calibre libraries, click on any one and browse the books in it. Click on a book, and it will show you all the metadata about the book, along with buttons to Read book and Download book. Click the Read book button to start reading the book.

Note: The address used above http://127.0.0.1:8080 will only work on the computer that is running calibre. To access the server from other computers/phones/tablets/etc. you will need to do a little more work, as described in the next section.

6.1 Accessing the Content server from other devices

There are two types of remote device access that you will typically need. The first, simpler kind is from within your home network. If you are running calibre on a computer on your home network and you have also connected your other devices to the same home network, then you should be easily able to access the server on those devices.

6.1.1 Accessing the server from devices on your home network

After starting the server in calibre as described above, click the Connect/share button again. Instead of the Start Content server action, you should see a Stop Content server action instead. To the right of this action will be listed an IP address and port number. These look like a bunch of numbers separated by periods. For example:

Stop Content server [192.168.1.5, port 8080]

These numbers tell you what address to use to connect to the server in your devices. Following the example above, the address becomes:

http://192.168.1.5:8080

The first part of the address is always http:// the next part is the IP address, which is the numbers before the comma and finally we have the port number which must be added to the IP address with a colon (:). If you are lucky, that should be all you need and you will be looking at the calibre libraries on your device. If not, read on.

Trouble-shooting the home network connection

If you are unable to access the server from your device, try the following steps:

1. Check that the server is running by opening the address http://127.0.0.1:8080 in a browser running on the same computer as the server.

2. Check that your firewall/anti-virus is allowing connections to your computer on the port 8080 and to the calibre program. The easiest way to eliminate the firewall/anti-virus as the source of problems is to temporarily turn them both off and then try connecting. You should first disconnect from the internet, before turning off the firewall, to keep your computer safe.

3. Check that your device and computer are on the same network. This means they should both be connected to the same wireless router. In particular neither should be using a cellular or ISP provided direct-WiFi connection.

4. If you have non-standard networking setup, it might be that the IP address shown on the Connect/share menu is incorrect. In such a case you will have to figure out what the correct IP address to use is, yourself. Unfortunately, given the infinite diversity of network configurations possible, it is not possible to give you a roadmap for doing so.
5. If you have setup a username and password, first try it without that to see if it is causing issues. Some e-ink devices have browsers that do not handle authentication. You can sometimes workaround this by including the username and password in the URL, for example: http://username:password@192.168.1.2:8080.

6. If you are stuck, you can always ask for help in the calibre user forums.

### 6.1.2 Accessing the server from anywhere on the internet

**Warning:** Before doing this you should turn on username/password protection in the server, otherwise anyone in the world will be able to access your books. Go to Preferences → Sharing → Sharing over the net and enable the option to Require username and password to access the content server.

While the particular details on setting up internet access vary depending on the network configuration and type of computer you are using, the basic schema is as follows.

1. Find out the external IP address of the computer you are going to run the server on. You can do that by visiting the site What is my IP address in a browser running on the computer.
2. If the computer is behind a router, enable port forwarding on the router to forward the port 8080 (or whatever port you choose to run the calibre Content server on) to the computer.
3. Make sure the calibre server is allowed through any firewalls/anti-virus programs on your computer.
4. Now you should be able to access the server on any internet-connected device using the IP address you found in the first step. For example, if the IP address you found was 123.123.123.123 and the port you are using for the calibre server is 8080, the address to use on your device becomes: http://123.123.123.123:8080.
5. Optionally, use a service like no-ip to setup an easy to remember address to use instead of the IP address you found in the first step.

**Note:** For maximum security, you should also enable HTTPS on the content server. You can either do so directly in the server by providing the path to the HTTPS certificate to use in the advanced configuration options for the server, or you can setup a reverse proxy as described below, to use an existing HTTPS setup.

### 6.2 The server interface

The server interface is a simplified version of the main calibre interface, optimised for use with touch screens. The home screen shows you books you are currently reading as well as allowing to choose a calibre library you want to browse. The server in calibre 3 gives you access to all your libraries, not just a single one, as before.

#### 6.2.1 The book list

The server book list is a simple grid of covers. Tap on a cover to see the detailed metadata for a book, or to read the book. If you prefer a more detailed list, you can change the default view by clicking the three vertical dots in the top right corner.

---

41 https://www.whatismyip.com/
42 https://www.noip.com/free
Sorting and searching of the book list should be familiar to calibre users. They can be accessed by clicking their icons in the top right area. They both work exactly the same as in the main calibre program. The search page even allows you to construct search queries by clicking on authors/tags/etc., just as you can using the Tag browser in the main program.

A much loved feature of the main program, Virtual libraries is present in the server interface as well. Click the three vertical dots in the top right corner to choose a virtual library.

### 6.2.2 The book reader

You can read any book in your calibre library by simply tapping on it and then tapping the Read book button. The books reader is very simple to operate. You can both tap and swipe to turn pages. Swiping up/down skips between chapters. Tapping the top quarter of the screen gets you the detailed controls and viewer preferences.

If you leave the Content server running, you can even open the same book on multiple devices and it will remember your last read position. If it does not you can force a sync by tapping in the top quarter and choosing Sync.

**Note:** On initial release, the book reader is fully functional but is missing some more advanced features from the main calibre viewer, such as popup footnotes, bookmarks and annotations in general. These will be added in due course. In fact, the browser reader is designed to eventually replace the main viewer, once it matures.

### 6.3 Browser support

The new calibre server makes lots of use of advanced HTML 5 and CSS 3 features. As such it requires an up-to-date browser to use. It has been tested on Android Chrome and iOS Safari as well as Chrome and Firefox on the desktop. It is known not to work with Internet Explorer and Microsoft Edge (hopefully Edge will start working when Microsoft gets around to implementing a few missing standards).

The server is careful to use functionality that has either been already standardised or is on the standards track. As such if it does not currently work with your favorite browser, it probably will once that browser has caught up.

If you are using a particularly old or limited browser or you don’t like to run JavaScript, you can use the mobile view, by simply adding /mobile to the server address.

**Note:** On iOS, Apple allows only a single browser engine, so Firefox, Chrome and Safari are all actually the same browser under the hood. The new server interface requires iOS 10.3.2 or newer. On Android, the server has been tested with Chrome version 58 and newer.

### 6.4 Managing user accounts from the command-line only

The calibre program has a nice section in Preferences to allow you to manage user accounts for the server. However, if you want to run the standalone server and cannot run the main calibre program on the same computer/user account, you can also manage users using just the command-line.

You can manage user accounts using the --manage-users option to the standalone calibre-server program. Suppose you want to store the user database in the directory /srv/calibre, then you create it by running:

```bash
calibre-server --userdb /srv/calibre/users.sqlite --manage-users
```
Just follow the prompts to create user accounts, set their permission, etc. Once you are done, you can run the server as:

```
$ calibre-server --userdb /srv/calibre/users.sqlite --enable-auth
```

It will use the user accounts you created in the previous step.

## 6.5 Integrating the calibre Content server into other servers

Here, we will show you how to integrate the calibre Content server into another server. The most common reason for this is to make use of SSL or to serve the calibre library as part of a larger site. The basic technique is to run the calibre server and setup a reverse proxy to it from the main server.

A reverse proxy is when your normal server accepts incoming requests and passes them onto the calibre server. It then reads the response from the calibre server and forwards it to the client. This means that you can simply run the calibre server as normal without trying to integrate it closely with your main server.

### 6.5.1 Using a full virtual host

The simplest configuration is to dedicate a full virtual host to the calibre server. In this case, run the calibre server as:

```
$ calibre-server
```

Now setup the virtual host in your main server, for example, for nginx:

```conf
server {
    listen [::]:80;
    server_name myserver.example.com;

    location / {
        proxy_pass http://127.0.0.1:8080;
    }
}
```

Or, for Apache:

```conf
LoadModule proxy_module modules/mod_proxy.so
LoadModule proxy_http_module modules/mod_proxy_http.so

<VirtualHost ::80>
    ServerName myserver.example.com
    AllowEncodedSlashes On
    ProxyPreserveHost On
    ProxyPass "/*" "http://localhost:8080"
</VirtualHost>
```

### 6.5.2 Using a URL prefix

If you do not want to dedicate a full virtual host to calibre, you can have it use a URL prefix. Start the calibre server as:

```
$ calibre-server --url-prefix /calibre --port 8080
```
The key parameter here is \texttt{--url-prefix /calibre}. This causes the Content server to serve all URLs prefixed by \texttt{/calibre}. To see this in action, visit \url{http://localhost:8080/calibre} in your browser. You should see the normal Content server website, but now it will run under \texttt{/calibre}.

With nginx, the required configuration is:

\begin{verbatim}
proxy_set_header X-Forwarded-For $remote_addr;
location /calibre/ {
    proxy_buffering off;
    proxy_pass http://127.0.0.1:8080$request_uri;
}
location /calibre {
    # we need a trailing slash for the Application Cache to work
    rewrite /calibre /calibre/ permanent;
}
\end{verbatim}

For Apache, first enable the proxy modules in Apache, by adding the following to \texttt{httpd.conf}:

\begin{verbatim}
LoadModule proxy_module modules/mod_proxy.so
LoadModule proxy_http_module modules/mod_proxy_http.so
\end{verbatim}

The exact technique for enabling the proxy modules will vary depending on your Apache installation. Once you have the proxy modules enabled, add the following rules to \texttt{httpd.conf} (or if you are using virtual hosts to the conf file for the virtual host in question):

\begin{verbatim}
AllowEncodedSlashes On
RewriteEngine on
RewriteRule ^/calibre/([^/]+) http://127.0.0.1:8080/calibre/$1 [proxy]
RedirectMatch permanent ^/calibre$ /calibre/
\end{verbatim}

That’s all, you will now be able to access the calibre Content server under the \texttt{/calibre} URL in your main server. The above rules pass all requests under \texttt{/calibre} to the calibre server running on port 8080 and thanks to the \texttt{--url-prefix} option above, the calibre server handles them transparently.

\textbf{Note:} When using a reverse proxy, you should tell the calibre Content server to only listen on localhost, by using \texttt{--listen-on 127.0.0.1}. That way, the server will only listen for connections coming from the same computer, i.e. from the reverse proxy.

\textbf{Note:} If you have setup SSL for your main server, you should tell the calibre server to use basic authentication instead of digest authentication, as it is faster. To do so, pass the \texttt{--auth-mode=basic} option to \texttt{calibre-server}.

\section*{6.6 Creating a service for the calibre server on a modern Linux system}

You can easily create a service to run calibre at boot on a modern (systemd\footnote{https://www.freedesktop.org/wiki/Software/systemd/}) based Linux system. Just create the file \texttt{/etc/systemd/system/calibre-server.service} with the contents shown below:

\begin{verbatim}
[Unit]
Description=calibre content server
\end{verbatim}

(continues on next page)
Change `mylinuxuser` and `mylinuxgroup` to whatever user and group you want the server to run as. This should be the same user and group that own the files in the calibre library directory. Note that it is generally not a good idea to run the server as root. Also change the path to the calibre library directory to suit your system. You can add multiple libraries if needed. See the help for the `calibre-server` command.

Now run:

```bash
sudo systemctl start calibre-server
```

to start the server. Check its status with:

```bash
sudo systemctl status calibre-server
```

To make it start at boot, run:

```bash
sudo systemctl enable calibre-server
```

**Note:** The calibre server *does not* need a running X server, but it does need the X libraries installed as some components it uses link against them.

**Note:** The calibre server also supports systemd socket activation, so you can use that, if needed, as well.
Calibre includes an integrated e-book comparison tool that can be used to see what has changed inside an e-book after editing or converting it. It can compare books in the EPUB and AZW3 formats.

To use it, either open the e-book in the tool for Editing e-books (page 79) and then click File → Compare to other book or use the Book details (page 16) panel. If you do a conversion from EPUB to EPUB, the original EPUB file will be saved as ORIGINAL_EPUB. Simply right click on the ORIGINAL_EPUB entry in the Book details panel and choose Compare to EPUB format.

The comparison tool that opens will look like the screenshot below. It shows you the differences in text, styles and images in the chosen books.
7.1 Understanding the comparison view

As can be seen in the screenshot above, the comparison view shows the differences between the two books side by side. Only the differences, with a few lines of context around them are shown. This makes it easy to see at a glance only what was changed inside a large document like a book.

Added text is shown with a green background, removed text with a red background and changed text with a blue background.

The line numbers of all changed text are show at the sides, making it easy to go to a particular change in the editor. When you open the comparison tool from within the editor, you can also double click on a line in the right panel to go to that line in the editor automatically.

One useful technique when comparing books is to tell the comparison tool to beautify the text and style files before calculating differences. This can often result in cleaner and easier to follow differences. To do this, click the *Options*
button in the bottom right and choose *Beautify files before comparing*. Note that beautifying can sometimes have undesired effects, as it can cause invalid markup to be altered to make it valid. You can also change the number of lines of context shown around differences via the *Options* button.

You can search for any text in the differences via the Search bar at the bottom. You will need to specify which panel to search, the *Left* or the *Right*.

### 7.2 Launching the comparison tool

The comparison tool is most useful when you have two versions of the same book and you want to see what is different between them. To that end, there are several ways to launch the tool.

#### 7.2.1 Comparing two e-book files

Open the first file in the *Editing e-books* (page 79) tool. Now click *File → Compare to another book* and choose the second file (it must be in the same format as the first). The comparison view will open with the file being edited on the right and the second file on the left.

#### 7.2.2 Comparing the ORIGINAL_FMT to FMT

When you do a conversion in calibre from a FMT to itself, the original file is saved as ORIGINAL_FMT. You can see what was changed by the conversion, by right clicking on the ORIGINAL_FMT entry in the *Book details* (page 16) panel in the main calibre window and selecting *Compare to FMT*. The comparison view will open with ORIGINAL_FMT on the left and FMT on the right.

#### 7.2.3 Comparing a checkpoint to the current state of the book while editing

The *Editing e-books* (page 79) tool has a very useful feature, called *Checkpoints* (page 91). This allows you to save the current state of the book as a named checkpoint, to which you can revert if you do not like the changes you have made since creating the checkpoint. Checkpoints are also created automatically when you perform various automated actions in the editor. You can see the list of checkpoints by going to *View → Checkpoints* and then use the *Compare* button to compare the book at the selected checkpoint with the current state. The comparison tool will show the checkpoint on the left and the current state on the right.
E-books come in all shapes and sizes and more often than not, their metadata (things like title/author/series/publisher) is incomplete or incorrect. The simplest way to change metadata in calibre is to simply double click on an entry and type in the correct replacement. For more sophisticated, “power editing” use the edit metadata tools discussed below.

### 8.1 Editing the metadata of one book at a time

Click the book you want to edit and then click the Edit metadata button or press the E key. A dialog opens that allows you to edit all aspects of the metadata. It has various features to make editing faster and more efficient. A list of the commonly used tips:

- You can click the button in between title and authors to swap them automatically.
- You can click the button next to author sort to have calibre automatically fill it in using the sort values stored with each author. Use the Manage authors dialog to see and change the authors’ sort values. This dialog can be opened by clicking and holding the button next to author sort.
- You can click the button next to tags to use the Tag editor to manage the tags associated with the book.
• The “Ids” box can be used to enter an ISBN (and many other types of id), it will have a red background if you enter an invalid ISBN. It will be green for valid ISBNs.

• The author sort box will be red if the author sort value differs from what calibre thinks it should be.

8.1.1 Downloading metadata

The nicest feature of the edit metadata dialog is its ability to automatically fill in many metadata fields by getting metadata from various websites. Currently, calibre uses isbndb.com, Google Books, Amazon and Library Thing. The metadata download can fill in Title, author, series, tags, rating, description and ISBN for you.

To use the download, fill in the title and author fields and click the Fetch metadata button. calibre will present you with a list of books that most closely match the title and author. If you fill in the ISBN field first, it will be used in preference to the title and author. If no matches are found, try making your search a little less specific by including only some key words in the title and only the author last name.

8.1.2 Managing book formats

In calibre, a single book entry can have many different formats associated with it. For example you may have obtained the Complete Works of Shakespeare in EPUB format and later converted it to MOBI to read on your Kindle. calibre automatically manages multiple formats for you. In the Available formats section of the Edit metadata dialog, you can manage these formats. You can add a new format, delete an existing format and also ask calibre to set the metadata and cover for the book entry from the metadata in one of the formats.

8.1.3 All about covers

You can ask calibre to download book covers for you, provided the book has a known ISBN. Alternatively you can specify a file on your computer to use as the cover. calibre can even generate a default cover with basic metadata on it for you. You can drag and drop images onto the cover to change it and also right click to copy/paste cover images.

In addition, there is a button to automatically trim borders from the cover, in case your cover image has an ugly border.

8.2 Editing the metadata of many books at a time

First select the books you want to edit by holding Ctrl or Shift and clicking on them. If you select more than one book, clicking the Edit metadata button will cause a new Bulk metadata edit dialog to open. Using this dialog, you can quickly set the author/publisher/rating/tags/series etc of a bunch of books to the same value. This is particularly useful if you have just imported a number of books that have some metadata in common. This dialog is very powerful, for example, it has a Search and Replace tab that you can use to perform bulk operations on metadata and even copy metadata from one column to another.

The normal edit metadata dialog also has Next and Previous buttons that you can use to edit the metadata of several books one after the other.

8.2.1 Search and replace

The Bulk metadata edit dialog allows you to perform arbitrarily powerful search and replace operations on the selected books. By default it uses a simple text search and replace, but it also support regular expressions. For more on regular expressions, see All about using regular expressions in calibre (page 193).
As noted above, there are two search and replace modes: character match and regular expression. Character match will look in the Search field you choose for the characters you type in the search for box and replace those characters with what you type in the replace with box. Each occurrence of the search characters in the field will be replaced. For example, assume the field being searched contains a bad cat. If you search for a to be replaced with HELLO, then the result will be HELLO bHELLOd cHELLOt.

If the field you are searching on is a multiple field like tags, then each tag is treated separately. For example, if your tags contain Horror, Scary, the search expression r, will not match anything because the expression will first be applied to Horror and then to Scary.

If you want the search to ignore upper/lowercase differences, uncheck the Case sensitive box.

You can have calibre change the case of the result (information after the replace has happened) by choosing one of the functions from the Apply function after replace box. The operations available are:

- **Lower case** – change all the characters in the field to lower case
- **Upper case** – change all the characters in the field to upper case
- **Title case** – capitalize each word in the result.

The Your test box is provided for you to enter text to check that search/replace is doing what you want. In the majority of cases the book test boxes will be sufficient, but it is possible that there is a case you want to check that isn’t shown in these boxes. Enter that case into Your test.

Regular expression mode has some differences from character mode, beyond (of course) using regular expressions. The first is that functions are applied to the parts of the string matched by the search string, not the entire field. The second is that functions apply to the replacement string, not to the entire field.

The third and most important is that the replace string can make reference to parts of the search string by using backreferences. A backreference is \n where n is an integer that refers to the n’th parenthesized group in the search expression. For example, given the same example as above, a bad cat, a search expression a (. . . ) (. . . ), and a replace expression a \2 \1, the result will be a cat bad. Please see the All about using regular expressions in calibre (page 193) for more information on backreferences.

One useful pattern: assume you want to change the case of an entire field. The easiest way to do this is to use character mode, but lets further assume you want to use regular expression mode. The search expression should be (.*) the replace expression should be \1, and the desired case change function should be selected.

Finally, in regular expression mode you can copy values from one field to another. Simply make the source and destination field different. The copy can replace the destination field, prepend to the field (add to the front), or append to the field (add at the end). The ‘use comma’ checkbox tells calibre to (or not to) add a comma between the text and the destination field in prepend and append modes. If the destination is multiple (e.g., tags), then you cannot uncheck this box.

Search and replace is done after all the other metadata changes in the other tabs are applied. This can lead to some confusion, because the test boxes will show the information before the other changes, but the operation will be applied after the other changes. If you have any doubts about what is going to happen, do not mix search/replace with other changes.

### 8.2.2 Bulk downloading of metadata

If you want to download the metadata for multiple books at once, right-click the Edit metadata button and select Download metadata. You can choose to download only metadata, only covers, or both.

• The EPUB I produced with calibre is not valid? (page 132)
• How do I use some of the advanced features of the conversion tools? (page 132)
9.1.1 What formats does calibre support conversion to/from?

Calibre supports the conversion of many input formats to many output formats. It can convert every input format in the following list, to every output format.

**Input Formats:** AZW, AZW3, AZW4, CBZ, CBR, CBC, CHM, DJVU, DOCX, EPUB, FB2, FBZ, HTML, HTMLZ, LIT, LRF, MOBI, ODT, PDF, PRC, PDB, PML, RB, RTF, SNB, TCR, TXT, TXTZ

**Output Formats:** AZW3, EPUB, DOCX, FB2, HTMLZ, OEB, LIT, LRF, MOBI, PDB, PMLZ, RB, PDF, RTF, SNB, TCR, TXT, TXTZ, ZIP

**Note:** PRC is a generic format, calibre supports PRC files with TextRead and MOBIBook headers. PDB is also a generic format. Calibre supports eReader, Plucker (input only), PML and zTxt PDB files. DJVU support is only for converting DJVU files that contain embedded text. These are typically generated by OCR software. MOBI books can be of two types Mobi6 and KF8. Calibre fully supports both. MOBI files often have .azw or .azw3 file extensions. DOCX files from Microsoft Word 2007 and newer are supported.

9.1.2 What are the best source formats to convert?

In order of decreasing preference: LIT, MOBI, AZW, EPUB, AZW3, FB2, FBZ, DOCX, HTML, PRC, ODT, RTF, PDB, TXT, PDF

9.1.3 I converted a PDF file, but the result has various problems?

PDF is a terrible format to convert from. For a list of the various issues you will encounter when converting PDF, see: [Convert PDF documents](page 74).

9.1.4 How do I convert my file containing non-English characters, or smart quotes?

There are two aspects to this problem:

1. Knowing the encoding of the source file: Calibre tries to guess what character encoding your source files use, but often, this is impossible, so you need to tell it what encoding to use. This can be done in the GUI via the Input character encoding field in the Look & feel → Text section of the conversion dialog. The command-line tools have an `ebook-convert-txt-input --input-encoding` option.

2. When adding HTML files to calibre, you may need to tell calibre what encoding the files are in. To do this go to Preferences → Advanced → Plugins → File Type plugins and customize the HTML2ZIP plugin, telling it what encoding your HTML files are in. Now when you add HTML files to calibre they will be correctly processed. HTML files from different sources often have different encodings, so you may have to change this setting repeatedly. A common encoding for many files from the web is `cp1252` and I would suggest you try that first. Note that when converting HTML files, leave the input encoding setting mentioned above blank. This is because the HTML2ZIP plugin automatically converts the HTML files to a standard encoding (utf-8).

9.1.5 What's the deal with Table of Contents in MOBI files?

The first thing to realize is that most e-books have two tables of contents. One is the traditional Table of Contents, like the ToC you find in paper books. This Table of Contents is part of the main document flow and can be styled however you like. This ToC is called the **content ToC**.
Then there is the metadata ToC. A metadata ToC is a ToC that is not part of the book text and is typically accessed by some special button on a reader. For example, in the calibre viewer, you use the Show Table of Contents button to see this ToC. This ToC cannot be styled by the book creator. How it is represented is up to the viewer program.

In the MOBI format, the situation is a little confused. This is because the MOBI format, alone amongst mainstream e-book formats, does not have decent support for a metadata ToC. A MOBI book simulates the presence of a metadata ToC by putting an extra content ToC at the end of the book. When you click Goto Table of Contents on your Kindle, it is to this extra content ToC that the Kindle takes you.

Now it might well seem to you that the MOBI book has two identical ToCs. Remember that one is semantically a content ToC and the other is a metadata ToC, even though both might have exactly the same entries and look the same. One can be accessed directly from the Kindle’s menus, the other cannot.

When converting to MOBI, calibre detects the metadata ToC in the input document and generates an end-of-file ToC in the output MOBI file. You can turn this off by an option in the MOBI Output settings. You can also tell calibre whether to put it and the start or the end of the book via an option in the MOBI Output settings. Remember this ToC is semantically a metadata ToC, in any format other than MOBI it cannot not be part of the text. The fact that it is part of the text in MOBI is an accident caused by the limitations of MOBI. If you want a ToC at a particular location in your document text, create one by hand. So we strongly recommend that you leave the default as it is, i.e. with the metadata ToC at the end of the book. Also note that if you disable the generation of the end-of-file ToC the resulting MOBI file may not function correctly on a Kindle, since the Kindle’s use the metadata ToC for many things, including the Page Flip feature.

If you have a hand edited ToC in the input document, you can use the ToC detection options in calibre to automatically generate the metadata ToC from it. See the conversion section of the User Manual for more details on how to use these options.

Finally, I encourage you to ditch the content ToC and only have a metadata ToC in your e-books. Metadata ToCs will give the people reading your e-books a much superior navigation experience (except on the Kindle, where they are essentially the same as a content ToC).

Note: The newer AZW3 format has proper support for a metadata ToC. However, the Kindle firmware tends to malfunction if you disable the generation of the end-of-file inline ToC. So it is recommended that you leave the generated ToC alone. If you create an AZW3 file with a metadata ToC and no end-of-file generated ToC, some features on the Kindle will not work, such as the Page Flip feature.

9.1.6 The covers for my MOBI files have stopped showing up in Kindle for PC/Kindle for Android/iPad etc.

This is caused by a bug in the Amazon software. You can work around it by going to Preferences→Conversion→Output Options→MOBI output and setting the Enable sharing of book content option. If you are reconverting a previously converted book, you will also have to enable the option in the conversion dialog for that individual book (as per book conversion settings are saved and take precedence).

Note that doing this will mean that the generated MOBI will show up under personal documents instead of Books on the Kindle Fire and Amazon whispersync will not work, but the covers will. It’s your choice which functionality is more important to you. I encourage you to contact Amazon and ask them to fix this bug.

The bug in Amazon’s software is that when you put a MOBI file on a Kindle, unless the file is marked as a Personal document, Amazon assumes you bought the book from it and tries to download the cover thumbnail for it from its servers. When the download fails, it refuses to fallback to the cover defined in the MOBI file. This is likely deliberate on Amazon’s part to try to force authors to sell only through them. In other words, Kindle’s only display covers for books marked as Personal Documents or books bought directly from Amazon.
If you send a MOBI file to an e-ink Kindle with calibre using a USB connection, calibre works around this Amazon bug by uploading a cover thumbnail itself. However, that workaround is only possible when using a USB connection and sending with calibre. Note that if you send using email, Amazon will automatically mark the MOBI file as a Personal Document and the cover will work, but the book will show up in Personal Documents.

### 9.1.7 How do I convert a collection of HTML files in a specific order?

In order to convert a collection of HTML files in a specific order, you have to create a table of contents file. That is, another HTML file that contains links to all the other files in the desired order. Such a file looks like:

```html
<html>
<body>
  <h1>Table of Contents</h1>
  <p style="text-indent:0pt">
    <a href="file1.html">First File</a>
    <a href="file2.html">Second File</a>
    ...
    ...
  </p>
</body>
</html>
```

Then, just add this HTML file to the GUI and use the Convert button to create your e-book. You can use the option in the Table of Contents section in the conversion dialog to control how the Table of Contents is generated.

**Note:** By default, when adding HTML files, calibre follows links in the files in depth first order. This means that if file A.html links to B.html and C.html and D.html, but B.html also links to D.html, then the files will be in the order A.html, B.html, D.html, C.html. If instead you want the order to be A.html, B.html, C.html, D.html then you must tell calibre to add your files in breadth first order. Do this by going to Preferences → Advanced → Plugins and customizing the HTML to ZIP plugin.

### 9.1.8 The EPUB I produced with calibre is not valid?

calibre does not guarantee that an EPUB produced by it is valid. The only guarantee it makes is that if you feed it valid XHTML 1.1 + CSS 2.1 it will output a valid EPUB. calibre tries hard to ensure that EPUBs it produces actually work as intended on a wide variety of devices, a goal that is incompatible with producing valid EPUBs, and one that is far more important to the vast majority of its users. If you need a tool that always produces valid EPUBs, calibre is not for you. This means, that if you want to send a calibre produced EPUB to an online store that uses an EPUB validity checker, you have to make sure that the EPUB is valid yourself, calibre will not do it for you – in other words you must feed calibre valid XHTML + CSS as the input documents.

### 9.1.9 How do I use some of the advanced features of the conversion tools?

You can get help on any individual feature of the converters by mousing over it in the GUI or running `ebook-convert dummy.html .epub -h` at a terminal. A good place to start is to look at the following demo file that demonstrates some of the advanced features html-demo.zip

---

## 9.2 Device integration

### 9.2.1 What devices does calibre support?

Calibre can directly connect to all the major (and most of the minor) e-book reading devices, smartphones, tablets, etc. In addition, using the `Connect to folder` function you can use it with any e-book reader that exports itself as a USB disk. Finally, you can connect wirelessly to any device that has a web browser using the calibre Content server.

### 9.2.2 How can I help get my device supported in calibre?

If your device appears as a USB disk to the operating system, adding support for it to calibre is very easy. We just need some information from you:

- Complete list of e-book formats that your device supports.
- Is there a special directory on the device in which all e-book files should be placed? Also does the device detect files placed in sub-directories?
- We also need information about your device that calibre will collect automatically. First, if your device supports SD cards, insert them. Then connect your device to the computer. In calibre go to `Preferences → Miscellaneous` and click the “Debug device detection” button. This will create some debug output. Copy it to a file and repeat the process, this time with your device disconnected from your computer.
- Send both the above outputs to us with the other information and we will write a device driver for your device.

Once you send us the output for a particular operating system, support for the device in that operating system will appear in the next release of calibre. To send us the output, open a bug report and attach the output to it. See calibre
9.2.3 My device is not being detected by calibre?

Follow these steps to find the problem:

- Make sure that you are connecting only a single device to your computer at a time. Do not have another calibre supported device like an iPhone/iPad etc. at the same time.

- If you are connecting an Apple iDevice (iPad, iPod Touch, iPhone), Apple no longer allows third party software to connect to their devices using a USB cable. Instead use a wireless connection, via the calibre Content server.

- Make sure you are running the latest version of calibre. The latest version can always be downloaded from the calibre website. You can tell what version of calibre you are currently running by looking at the bottom line of the main calibre window.

- Ensure your operating system is seeing the device. That is, the device should show up in Windows Explorer (in Windows) or Finder (in macOS).

- In calibre, go to Preferences → Ignored Devices and check that your device is not being ignored

- If all the above steps fail, go to Preferences → Miscellaneous and click Debug device detection with your device attached and post the output as a ticket on the calibre bug tracker.

9.2.4 My device is non-standard or unusual. What can I do to connect to it?

In addition to the Connect to folder function found under the Connect/share button, calibre provides a User defined device plugin that can be used to connect to any USB device that shows up as a disk drive in your operating system. Note: on Windows, the device must have a drive letter for calibre to use it. See the device plugin Preferences -> Plugins -> Device plugins -> User defined and Preferences -> Miscellaneous -> Get information to setup the user defined device for more information. Note that if you are using the user defined plugin for a device normally detected by a builtin calibre plugin, you must disable the builtin plugin first, so that your user defined plugin is used instead.

9.2.5 How does calibre manage collections on my SONY reader?

When calibre connects with the reader, it retrieves all collections for the books on the reader. The collections of which books are members are shown on the device view.

When you send a book to the reader, calibre will add the book to collections based on the metadata for that book. By default, collections are created from tags and series. You can control what metadata is used by going to Preferences → Advanced → Plugins → Device Interface plugins and customizing the SONY device interface plugin. If you remove all values, calibre will not add the book to any collection.

Collection management is largely controlled by the ‘Metadata management’ option found at Preferences → Import/export → Sending books to devices. If set to ‘Manual’ (the default), managing collections is left to the user; calibre will not delete already existing collections for a book on your reader when you resend the book to the reader, but calibre will add the book to collections if necessary. To ensure that the collections for a book are based only on current calibre metadata, first delete the books from the reader, then resend the books. You can edit collections directly on the device view by double-clicking or right-clicking in the collections column.

If ‘Metadata management’ is set to ‘Only on send’, then calibre will manage collections more aggressively. Collections will be built using calibre metadata exclusively. Sending a book to the reader will correct the collections for that book

---

45 https://calibre-ebook.com/bugs
46 https://calibre-ebook.com/download
47 https://bugs.launchpad.net/calibre
so its collections exactly match the book’s metadata, adding and deleting collections as necessary. Editing collections on the device view is not permitted, because collections not in the metadata will be removed automatically.

If ‘Metadata management’ is set to ‘Automatic management’, then calibre will update metadata and collections both when the reader is connected and when books are sent. When calibre detects the reader and generates the list of books on the reader, it will send metadata from the library to the reader for all books on the reader that are in the library (On device is True), adding and removing books from collections as indicated by the metadata and device customization. When a book is sent, calibre corrects the metadata for that book, adding and deleting collections. Manual editing of metadata on the device view is not allowed. Note that this option specifies sending metadata, not books. The book files on the reader are not changed.

In summary, choose ‘manual management’ if you want to manage collections yourself. Collections for a book will never be removed by calibre, but can be removed by you by editing on the device view. Choose ‘Only on send’ if you want calibre to manage collections when you send a book, adding books to and removing books from collections as needed. Choose ‘Automatic management’ if you want calibre to keep collections up to date whenever the reader is connected.

If you use multiple installations of calibre to manage your reader, then option ‘Automatic management’ may not be what you want. Connecting the reader to one library will reset the metadata to what is in that library. Connecting to the other library will reset the metadata to what is in that other library. Metadata in books found in both libraries will be flopped back and forth.

9.2.6 Can I use both calibre and the SONY software to manage my reader?

Yes, you can use both, provided you do not run them at the same time. That is, you should use the following sequence: Connect reader->Use one of the programs->Disconnect reader. Reconnect reader->Use the other program->disconnect reader.

The underlying reason is that the Reader uses a single file to keep track of ‘meta’ information, such as collections, and this is written to by both calibre and the Sony software when either updates something on the Reader. The file will be saved when the Reader is (safely) disconnected, so using one or the other is safe if there’s a disconnection between them, but if you’re not the type to remember this, then the simple answer is to stick to one or the other for the transfer and just export/import from/to the other via the computers hard disk.

If you do need to reset your metadata due to problems caused by using both at the same time, then just delete the media.xml file on the Reader using your PC’s file explorer and it will be recreated after disconnection.

With recent reader iterations, SONY, in all its wisdom has decided to try to force you to use their software. If you install it, it auto-launches whenever you connect the reader. If you don’t want to uninstall it altogether, there are a couple of tricks you can use. The simplest is to simply re-name the executable file that launches the library program. More detail in the forums48.

9.2.7 How do I use calibre with my iPad/iPhone/iPod touch?

The easiest way to transfer books wirelessly to your Apple device (iPad/iPhone/iPod) is to use the Calibre Companion49 iOS app. This app is maintained by a core calibre developer and allows calibre to connect to your Apple device wirelessly, just as though you plugged in the device with a USB cable. You can browse files on the device in calibre and use the Send to device button to transfer files to your device wirelessly.

Another easy way to browse your calibre collection from your Apple device is by using the calibre Content server, which makes your collection available over the net. First perform the following steps in calibre

- Set the Preferred Output Format in calibre to EPUB (The output format can be set under Preferences→Interface→Behavior)

49 http://www.multipie.co.uk/calibre-companion/
Set the output profile to iPad (this will work for iPhone/iPods as well), under Preferences → Conversion → Common options → Page setup.

Convert the books you want to read on your iDevice to EPUB format by selecting them and clicking the Convert button.

Turn on the Content server by clicking the Connect/share button and leave calibre running. You can also tell calibre to automatically start the Content server via Preferences → Sharing → Sharing over the net.

The Content server allows you to read books directly in Safari itself. In addition, there are many apps for your iDevice that can connect to the calibre Content server. Examples include: Marvin, Mapleread and iBooks itself.

Using the Content server

Start the Safari browser and type in the IP address and port of the computer running the calibre server, like this:

http://192.168.1.2:8080/

Replace 192.168.1.2 with the local IP address of the computer running calibre. See The calibre Content server (page ??) for details on running the server and finding out the right IP address to use.

You will see a list of books in Safari, tap on any book and you will be given the option to either download it, or read it in the browser itself. If you choose to download it, Safari will ask you if you want to open it with iBooks.

9.2.8 How do I use calibre with my Android phone/tablet or Kindle Fire HD?

There are two ways that you can connect your Android device to calibre. Using a USB cable – or wirelessly, over the air. The first step to using an Android device is installing an e-book reading application on it. There are many free and paid e-book reading applications for Android: Some examples (in no particular order): FBReader, Moon+, Mantano, Aldiko, Kindle.

Using a USB cable

Simply plug your device into the computer with a USB cable. calibre should automatically detect the device and then you can transfer books to it by clicking the Send to device button. calibre does not have support for every single android device out there, so if your device is not automatically detected, follow the instructions at How can I help get my device supported in calibre? (page 133) to get your device supported in calibre.

Note: With newer Android devices, you might have to jump through a few hoops to get the connection working, as Google really does not want you to be independent of its cloud. First, unlock the screen before plugging in the USB cable. When you plugin in the USB cable you will get a popup notification. Make sure it says something like “Transferring Media files” or “MTP (Media Transfer mode)”. If it does not, tap the notification, and change the mode to Media Transfer (MTP). Finally, you might get a popup on the device every time calibre or the operating system actually tries to connect to it, asking for permission, tap OK.

---

Over the air

The easiest way to transfer books wirelessly to your Android device is to use the Calibre Companion Android app. This app is maintained by a core calibre developer and allows calibre to connect to your Android device wirelessly, just as though you plugged in the device with a USB cable. You can browse files on the device in calibre and use the Send to device button to transfer files to your device wirelessly.

calibre also has a built-in web server, the Content server. You can browse your calibre collection on your Android device by using the calibre Content server, which makes your collection available over the net. First perform the following steps in calibre:

- Set the Preferred Output Format in calibre to EPUB for normal Android devices or MOBI for Kindles (The output format can be set under Preferences → Interface → Behavior)
- Convert the books you want to read on your device to EPUB/MOBI format by selecting them and clicking the Convert button.
- Turn on the Content server in calibre's preferences and leave calibre running.

Now on your Android device, open the browser and browse to:

http://192.168.1.2:8080/

Replace 192.168.1.2 with the local IP address of the computer running calibre. See The calibre Content server (page ??) for details on running the server and finding out the right IP address to use.

You can now browse your book collection and download books from calibre to your device to open with whatever e-book reading software you have on your android device.

Calibre Companion and many reading apps support browsing the calibre library directly. For example, in Aldiko, click My Catalogs, then + to add a catalog, then give the catalog a title such as “calibre” and provide the URL listed above. You can now browse the calibre library and download directly into the reading software.

9.2.9 Can I access my calibre books using the web browser in my Kindle or other reading device?

calibre has a Content server that exports the books in calibre as a web page. See The calibre Content server (page ??) for details.

Some devices, like the Kindle (1/2/DX), do not allow you to access port 8080 (the default port on which the content server runs). In that case, change the port in the calibre Preferences to 80. (On some operating systems, you may not be able to run the server on a port number less than 1024 because of security settings. In this case the simplest solution is to adjust your router to forward requests on port 80 to port 8080).

Also some devices do not have browsers advanced enough to run the app-like interface used by the content server. For such devices, you can simply add /mobile to the server URL to get a simplified, non-javascript interface.

9.2.10 I cannot send emails using calibre?

Because of the large amount of spam in email, sending email can be tricky, as different mail servers use different strategies to block email. The most common problem is if you are sending email directly (without a mail relay) in calibre. Many servers (for example, Amazon) block email that does not come from a well known relay. The most robust way to setup email sending in calibre is to do the following:

- Create a free GMX account at GMX.

55 http://www.multipie.co.uk/calibre-companion/
56 https://www.gmx.com
• Goto Preferences→Sharing→Sharing books by email in calibre and click the Use GMX button and fill in the information asked for.

• Log into your GMX account on the website and enable SMTP sending (Settings->POP3 & IMAP->Send and receive emails via external program)

• calibre will then be able to use GMX to send the mail.

• If you are sending to your Kindle, remember to update the email preferences on your Amazon Kindle page to allow email sent from your GMX email address. Also note that Amazon does not allow email delivery of AZW3 and new style (KF8) MOBI files.

Even after doing this, you may have problems. One common source of problems is that some poorly designed antivirus programs block calibre from opening a connection to send email. Try adding an exclusion for calibre in your antivirus program.

Note: Microsoft/Google/Gmx can disable your account if you use it to send large amounts of email. So, when using these services to send mail calibre automatically restricts itself to sending one book every five minutes. If you don’t mind risking your account being blocked you can reduce this wait interval by going to Preferences→Advanced→Tweaks in calibre.

Note: Google recently deliberately broke their email sending protocol (SMTP) support in an attempt to force everyone to use their web interface so they can show you more ads. They are trying to claim that SMTP is insecure, that is incorrect and simply an excuse. If you have trouble with gmail you will need to allow “less secure” apps as described here.

Note: If you are concerned about giving calibre access to your email account, simply create a new free email account with GMX or Hotmail and use it only for calibre.

9.2.11 My device is getting mounted read-only in linux, so calibre cannot connect to it?

Linux kernels mount devices read-only when their filesystems have errors. You can repair the filesystem with:

```bash
sudo fsck.vfat -y /dev/sdc
```

Replace /dev/sdc with the path to the device node of your device. You can find the device node of your device, which will always be under /dev by examining the output of:

```bash
mount
```

9.2.12 Why does calibre not support collections on the Kindle or shelves on the Nook?

Neither the Kindle nor the Nook provide any way to manipulate collections over a USB connection. If you really care about using collections, I would urge you to sell your Kindle/Nook and get a Kobo. Only Kobo seems to understand that life is too short to be entering collections one by one on an e-ink screen :)

57 https://support.google.com/accounts/answer/6010255
Note that in the case of the Kindle, there is a way to manipulate collections via USB, but it requires that the Kindle be rebooted every time it is disconnected from the computer, for the changes to the collections to be recognized. As such, it is unlikely that any calibre developers will ever feel motivated enough to support it. There is however, a calibre plugin that allows you to create collections on your Kindle from the calibre metadata. It is available from here.58

Note: Amazon have removed the ability to manipulate collections completely in their newer models, like the Kindle Touch and Kindle Fire, making even the above plugin useless, unless you root your Kindle and install custom firmware.

9.2.13 I am getting an error when I try to use calibre with my Kobo Touch/Glo/etc.?

The Kobo has very buggy firmware. Connecting to it has been known to fail at random. Certain combinations of motherboard, USB ports/cables/hubs can exacerbate this tendency to fail. If you are getting an error when connecting to your touch with calibre try the following, each of which has solved the problem for some calibre users.

- Connect the Kobo directly to your computer, not via USB Hub
- Try a different USB cable and a different USB port on your computer
- Try a different computer, in particular the Kobo does not work well with some Windows XP machines. If you are on Windows XP, try a computer with a newer version of Windows.
- Log out of the Kobo and log in again, this causes it to rebuild the database, fixing corrupted database errors.
- Try upgrading the firmware on your Kobo Touch to the latest
- Try resetting the Kobo (sometimes this cures the problem for a little while, but then it re-appears, in which case you have to reset again and again)
- Try only putting one or two books onto the Kobo at a time and do not keep large collections on the Kobo

9.2.14 I transferred some books to my Kindle using calibre and they did not show up?

Books sent to the Kindle only show up on the Kindle after they have been indexed by the Kindle. This can take some time. If the book still does not show up after some time, then it is likely that the Kindle indexer crashed. Sometimes a particular book can cause the indexer to crash. Unfortunately, Amazon has not provided any way to deduce which book is causing a crash on the Kindle. Your only recourse is to either reset the Kindle, or delete all files from its memory using Windows Explorer (or whatever file manager you use) and then send the books to it again, one by one, until you discover the problem book. Once you have found the problem book, delete it off the Kindle and do a MOBI to MOBI or MOBI to AZW3 conversion in calibre and then send it back. This will most likely take care of the problem.

9.3 Library Management

Contents

- Where are the book files stored? (page 140)
- How does calibre manage author names and sorting? (page 140)

9.3.1 Where are the book files stored?

When you first run calibre, it will ask you for a folder in which to store your books. Whenever you add a book to calibre, it will copy the book into that folder. Books in the folder are nicely arranged into sub-folders by Author and Title. Note that the contents of this folder are automatically managed by calibre, do not add any files/folders manually to this folder, as they may be automatically deleted. If you want to add a file associated to a particular book, use the top right area of Edit metadata dialog to do so. Then, calibre will automatically put that file into the correct folder and move it around when the title/author changes.

Metadata about the books is stored in the file metadata.db at the top level of the library folder. This file is a sqlite database. When backing up your library make sure you copy the entire folder and all its sub-folders.

The library folder and all its contents make up what is called a calibre library. You can have multiple such libraries. To manage the libraries, click the calibre icon on the toolbar. You can create new libraries, remove/rename existing ones and switch between libraries easily.

You can copy or move books between different libraries (once you have more than one library setup) by right clicking on a book and selecting the Copy to library action.

9.3.2 How does calibre manage author names and sorting?

Author names are complex, especially across cultures, see this note\textsuperscript{59} for some of the complexities. calibre has a very flexible strategy for managing author names. The first thing to understand is that books and authors are separate entities in calibre. A book can have more than one author, and an author can have more than one book. You can manage the authors of a book by the edit metadata dialog. You can manage individual authors by right clicking on the author in the Tag browser on the left of the main calibre screen and selecting Manage authors. Using this dialog you can change the name of an author and also how that name is sorted. This will automatically change the name of the author in all the books of that author. When a book has multiple authors, separate their names using the & character.

Now coming to author name sorting:

- When a new author is added to calibre (this happens whenever a book by a new author is added), calibre automatically computes a sort string for both the book and the author.
- Authors in the Tag browser are sorted by the sort value for the authors. Remember that this is different from the Author sort field for a book.
- By default, this sort algorithm assumes that the author name is in First name Last name format and generates a Last name, First name sort value.
- You can change this algorithm by going to Preferences→Advanced→Tweaks and setting the author_sort_copy_method tweak.

\textsuperscript{59} https://www.w3.org/International/questions/qa-personal-names.en.php?changelang=en
• You can force calibre to recalculate the author sort values for every author by right clicking on any author and selecting Manage authors, then pushing the Recalculate all author sort values button. Do this after you have set the author_sort_copy_method tweak to what you want.

• You can force calibre to recalculate the author sort values for all books by using the bulk metadata edit dialog (select all books and click edit metadata, check the Automatically set author sort checkbox, then press OK.)

• When recalculating the author sort values for books, calibre uses the author sort values for each individual author. Therefore, ensure that the individual author sort values are correct before recalculating the books’ author sort values.

• You can control whether the Tag browser display authors using their names or their sort values by setting the categories_use_field_for_author_name tweak in Preferences→Advanced→Tweaks.

Note that you can set an individual author's sort value to whatever you want using Manage authors. This is useful when dealing with names that calibre will not get right, such as complex multi-part names like Miguel de Cervantes Saavedra or when dealing with Asian names like Sun Tzu.

With all this flexibility, it is possible to have calibre manage your author names however you like. For example, one common request is to have calibre display author names LN, FN. To do this, and if the note below does not apply to you, then:

• Set the author_sort_copy_method tweak to copy as described above.

• Restart calibre. Do not change any book metadata before doing the remaining steps.

• Change all author names to LN, FN using the Manage authors dialog.

• After you have changed all the authors, press the Recalculate all author sort values button.

• Press OK, at which point calibre will change the authors in all your books. This can take a while.

Note:

When changing from FN LN to LN, FN, it is often the case that the values in author_sort are already in LN, FN format. If this is your case, then do the following:

• Set the author_sort_copy_method tweak to copy as described above.

• Restart calibre. Do not change any book metadata before doing the remaining steps.

• Open the Manage authors dialog. Press the copy all author sort values to author button.

• Check through the authors to be sure you are happy. You can still press Cancel to abandon the changes. Once you press OK, there is no undo.

• Press OK, at which point calibre will change the authors in all your books. This can take a while.

9.3.3 Why doesn’t calibre let me store books in my own directory structure?

The whole point of calibre’s library management features is that they provide a search and sort based interface for locating books that is much more efficient than any possible directory scheme you could come up with for your collection. Indeed, once you become comfortable using calibre’s interface to find, sort and browse your collection, you wont ever feel the need to hunt through the files on your disk to find a book again. By managing books in its own directory structure of Author -> Title -> Book files, calibre is able to achieve a high level of reliability and standardization. To illustrate why a search/tagging based interface is superior to folders, consider the following. Suppose your book collection is nicely sorted into folders with the following scheme:

<table>
<thead>
<tr>
<th>Genre</th>
<th>Author</th>
<th>Series</th>
<th>ReadStatus</th>
</tr>
</thead>
</table>

9.3. Library Management 141
Now this makes it very easy to find for example all science fiction books by Isaac Asimov in the Foundation series. But suppose you want to find all unread science fiction books. There’s no easy way to do this with this folder scheme, you would instead need a folder scheme that looks like:

```
ReadStatus -> Genre -> Author -> Series
```

In calibre, you would instead use tags to mark genre and read status and then just use a simple search query like `tag:scifi and not tag:read`. calibre even has a nice graphical interface, so you don’t need to learn its search language instead you can just click on tags to include or exclude them from the search.

To those of you that claim that you need access to the filesystem, so that you can have access to your books over the network, calibre has an excellent Content server that gives you access to your calibre library over the net.

If you are worried that someday calibre will cease to be developed, leaving all your books marooned in its folder structure, explore the powerful `Save to Disk` feature in calibre that lets you export all your files into a folder structure of arbitrary complexity based on their metadata.

Finally, the reason there are numbers at the end of every title folder, is for robustness. That number is the id number of the book record in the calibre database. The presence of the number allows you to have multiple records with the same title and author names. It is also part of what allows calibre to magically regenerate the database with all metadata if the database file gets corrupted. Given that calibre’s mission is to get you to stop storing metadata in filenames and stop using the filesystem to find things, the increased robustness afforded by the id numbers is well worth the uglier folder names.

If you are still not convinced, then I’m afraid calibre is not for you. Look elsewhere for your book cataloguing needs. Just so we’re clear, **this is not going to change**. Kindly do not contact us in an attempt to get us to change this.

### 9.3.4 Why doesn’t calibre have a column for foo?

calibre is designed to have columns for the most frequently and widely used fields. In addition, you can add any columns you like. Columns can be added via `Preferences → Interface → Add your own columns`. Watch the tutorial [UI Power tips](https://calibre-ebook.com/demo#tutorials) to learn how to create your own columns, or read [this blog post](http://blog.calibre-ebook.com/2011/11/calibre-custom-columns.html).

You can also create “virtual columns” that contain combinations of the metadata from other columns. In the add column dialog use the `Quick create` links to easily create columns to show the book ISBN or formats. You can use the powerful calibre template language to do much more with columns. For more details, see [The calibre template language](page 161).

### 9.3.5 Can I have a column showing the formats or the ISBN?

Yes, you can. Follow the instructions in the answer above for adding custom columns.

### 9.3.6 How do I move my calibre data from one computer to another?

You can export all calibre data (books, settings and plugins) and then import it on another computer. First let’s see how to export the data:

- Right click the calibre icon in the main calibre toolbar and select `Export/import all calibre data`. Note that if there is currently a device connected, this menu option will not be available — so, disconnect any connected devices. Then click the button labelled `Export all your calibre data`. You will see a list of all your calibre libraries. Click OK and choose an empty folder somewhere on your computer. The exported data will be saved in this folder. Simply copy this folder to your new computer and follow the instructions below to import the data.

---

60 https://calibre-ebook.com/demo#tutorials
• Install calibre on your new computer and run through the Welcome wizard, it does not matter what you do there, as you will be importing your old settings in the next step. You will now have an empty calibre, with just the Getting Started guide in your library. Once again, right click the calibre button and choose Export/import all calibre data. Then click the button labelled Import previously exported data. Select the folder with the exported data that you copied over earlier. You will now have a list of libraries you can import. Go through the list one by one, and select the new location for each library (a location is just an empty folder somewhere on your computer). Click OK. After the import completes, calibre will restart, with all your old libraries, settings and calibre plugins.

Note: This import/export functionality is only available from calibre version 2.47 onwards. If you have an older version of calibre, or if you encounter problems with the import/export, you can just copy over your calibre library folder manually, as described in the next paragraph.

Simply copy the calibre library folder from the old to the new computer. You can find out what the library folder is by clicking the calibre icon in the toolbar. Choose the Switch/create calibre library action and you will see the path to the current calibre library.

Now on the new computer, start calibre for the first time. It will run the Welcome wizard asking you for the location of the calibre library. Point it to the previously copied folder. If the computer you are transferring to already has a calibre installation, then the Welcome wizard won’t run. In that case, right-click the calibre icon in the toolbar and point it to the newly copied directory. You will now have two calibre libraries on your computer and you can switch between them by clicking the calibre icon on the toolbar. Transferring your library in this manner preserves all your metadata, tags, custom columns, etc.

9.3.7 The list of books in calibre is blank!

In order to understand why that happened, you have to understand what a calibre library is. At the most basic level, a calibre library is just a folder. Whenever you add a book to calibre, that book’s files are copied into this folder (arranged into sub folders by author and title). Inside the calibre library folder, at the top level, you will see a file called metadata.db. This file is where calibre stores the metadata like title/author/rating/tags etc. for every book in your calibre library. The list of books that calibre displays is created by reading the contents of this metadata.db file.

There can be two reasons why calibre is showing an empty list of books:

• Your calibre library folder changed its location. This can happen if it was on an external disk and the drive letter for that disk changed. Or if you accidentally moved the folder. In this case, calibre cannot find its library and so starts up with an empty library instead. To remedy this, do a right-click on the calibre icon in the calibre toolbar and select Switch/create library. Click the little blue icon to select the new location of your calibre library and click OK. If you don’t know the new location search your computer for the file metadata.db.

• Your metadata.db file was deleted/corrupted. In this case, you can ask calibre to rebuild the metadata.db from its backups. Right click the calibre icon in the calibre toolbar and select Library maintenance->Restore database. Calibre will automatically rebuild metadata.db.

9.3.8 I am getting errors with my calibre library on a networked drive/NAS?

Do not put your calibre library on a networked drive.

A filesystem is a complex beast. Most network filesystems lack various filesystem features that calibre uses. Some don’t support file locking, some don’t support hardlinking, some are just flaky. Additionally, calibre is a single user application, if you accidentally run two copies of calibre on the same networked library, bad things will happen. Finally, different OSes impose different limitations on filesystems, so if you share your networked drive across OSes, once again, bad things will happen.
Consider using the calibre Content server to make your books available on other computers. Run calibre on a single computer and access it via the Content server or a Remote Desktop solution.

If you must share the actual library, use a file syncing tool like Dropbox or rsync instead of a networked drive. If you are using a file-syncing tool it is essential that you make sure that both calibre and the file syncing tool do not try to access the calibre library at the same time. In other words, do not run the file syncing tool and calibre at the same time.

Even with these tools there is danger of data corruption/loss, so only do this if you are willing to live with that risk. In particular, be aware that Google Drive is incompatible with calibre, if you put your calibre library in Google Drive, you will suffer data loss. See this thread⁶² for details.

### 9.4 Miscellaneous

#### Contents

- I want calibre to download news from my favorite news website. (page 144)
- Why the name calibre? (page 145)
- Why does calibre show only some of my fonts on macOS? (page 145)
- calibre is not starting on Windows? (page 145)
- calibre freezes/crashes occasionally? (page 146)
- Using the viewer or doing any conversions results in a permission denied error on Windows (page 146)
- calibre is not starting/crashing on macOS? (page 147)
- I downloaded the installer, but it is not working? (page 147)
- My antivirus program claims calibre is a virus/trojan? (page 148)
- How do I backup calibre? (page 148)
- How do I use purchased EPUB books with calibre (or what do I do with .acsm files)? (page 148)
- I am getting a “Permission Denied” error? (page 148)
- Can I have the comment metadata show up on my reader? (page 149)
- How do I get calibre to use my HTTP proxy? (page 149)
- I want some feature added to calibre. What can I do? (page 149)
- Why doesn’t calibre have an automatic update? (page 149)
- How is calibre licensed? (page 150)
- How do I run calibre from my USB stick? (page 150)
- How do I run parts of calibre like news download and the Content server on my own linux server? (page 150)

### 9.4.1 I want calibre to download news from my favorite news website.

If you are reasonably proficient with computers, you can teach calibre to download news from any website of your choosing. To learn how to do this see Adding your favorite news website (page 25).

---

Otherwise, you can request a particular news site by posting in the calibre Recipes forum\textsuperscript{63}.

9.4.2 Why the name calibre?

Take your pick:

- Convertor And LIBRary for E-books
- A high calibre product
- A tribute to the SONY Librie which was the first e-ink based e-book reader
- My wife chose it :-(

calibre is pronounced as cal-i-ber not ca-li-bre. If you’re wondering, calibre is the British/commonwealth spelling for caliber. Being Indian, that’s the natural spelling for me.

9.4.3 Why does calibre show only some of my fonts on macOS?

calibre embeds fonts in e-book files it creates. E-book files support embedding only TrueType and OpenType (.ttf and .otf) fonts. Most fonts on macOS systems are in .dfont format, thus they cannot be embedded. calibre shows only TrueType and OpenType fonts found on your system. You can obtain many such fonts on the web. Simply download the .ttf/.otf files and add them to the Library/Fonts directory in your home directory.

9.4.4 calibre is not starting on Windows?

There can be several causes for this:

- If you are on Windows XP, or on a computer with a processor that does not support SSE2 (such as AMD processors from before 2003) try installing calibre version 1.48\textsuperscript{64}. calibre 2.0 and newer use Qt 5 which is known to be incompatible with Windows XP machines, and requires SSE2. Simply un-install calibre and then install version 1.48, doing so will not affect your books/settings.

- If you get an error about calibre not being able to open a file because it is in use by another program, do the following:
  - Uninstall calibre
  - Reboot your computer
  - Re-install calibre. But do not start calibre from the installation wizard.
  - Temporarily disable your antivirus program (disconnect from the Internet before doing so, to be safe)
  - Look inside the folder you chose for your calibre library. If you see a file named metadata.db, delete it.
  - Start calibre
  - From now on you should be able to start calibre normally.

- If you get an error about a Python function terminating unexpectedly after upgrading calibre, first uninstil calibre, then delete the folders (if they exists) C:\Program Files\Calibre and C:\Program Files\Calibre2. Now re-install and you should be fine.

- If you get an error in the Welcome wizard on an initial run of calibre, try choosing a folder like C:\library as the calibre library (calibre sometimes has trouble with library locations if the path contains non-English characters, or only numbers, etc.)

\textsuperscript{63} https://www.mobileread.com/forums/forumdisplay.php?f=228
\textsuperscript{64} https://download.calibre-ebook.com/1.48.0/
• Try running it as Administrator (Right click on the icon and select “Run as Administrator”)

If it still won’t launch, start a command prompt (press the Windows key and R; then type `cmd.exe` in the Run dialog that appears). At the command prompt type the following command and press Enter:

```
calibre-debug -g
```

Post any output you see in a help message on the Forum⁶⁵.

### 9.4.5 calibre freezes/crashes occasionally?

There are several possible things I know of, that can cause this:

- You recently connected an external monitor or TV to your computer. In this case, whenever calibre opens a new window like the edit metadata window or the conversion dialog, it appears on the second monitor where you don’t notice it and so you think calibre has frozen. Disconnect your second monitor and restart calibre.

- The following programs have been reported to cause crashes in calibre: If you are running any of these, close them before starting calibre, or uninstall them: RoboForm, Logitech SetPoint Settings, Constant Guard Protection by Xfinity, Spybot, Killer Network Manager, Nahmic UI Interface, Acronis True Image.

- You are using a Wacom branded USB mouse/tablet. There is an incompatibility between Wacom drivers and the graphics toolkit calibre uses. Try using a non-Wacom mouse.

- On some 64 bit versions of Windows there are security software/settings that prevent 64-bit calibre from working properly. If you are using the 64-bit version of calibre try switching to the 32-bit version.

- If the crash happens when you are trying to copy text from the calibre E-book viewer, it is most likely caused by some clipboard monitoring/managing application you have running. Turn it off and you should be fine.

- If the crashes happen specifically when you are using a file dialog, like clicking on the Add books button or the Save to Disk button, then you have some software that has installed broken Shell extensions on your computer. Known culprits include: SpiderOak, odrive sync and Dell Backup and Recovery and NetDrive. If you have one of these, uninstall them and you will be fine. You can also use the NirSoft Shell Extension Viewer⁶⁶ to see what shell extensions are installed on your system and disable them individually, if you don’t want to uninstall the full program. Remember to use “Restart Explorer” or reboot your computer after disabling the shell extensions.

If none of the above apply to you, then there is some other program on your computer that is interfering with calibre. First reboot your computer in safe mode, to have as few running programs as possible, and see if the crashes still happen. If they do not, then you know it is some program causing the problem. The most likely such culprit is a program that modifies other programs’ behavior, such as an antivirus, a device driver, something like RoboForm (an automatic form filling app) or an assistive technology like Voice Control or a Screen Reader.

The only way to find the culprit is to eliminate the programs one by one and see which one is causing the issue. Basically, stop a program, run calibre, check for crashes. If they still happen, stop another program and repeat.

### 9.4.6 Using the viewer or doing any conversions results in a permission denied error on Windows

Something on your computer is preventing calibre from accessing its own temporary files. Most likely the permissions on your Temp folder are incorrect. Go to the folder file: `C:\Users\USERNAME\AppData\Local` in Windows Explorer and then right click on the file: Temp folder, select Properties and go to the Security tab. Make sure that your user account has full control for this folder.

---

⁶⁶ https://www.nirsoft.net/utils/shexview.html
Some users have reported that running the following command in an Administrator Command Prompt fixed their permissions. To get an Administrator Command Prompt search for cmd.exe in the start menu, then right click on the command prompt entry and select Run as Administrator. At the command prompt type the following command and press Enter:

```
icacls "%appdata%\..\Local\Temp" /reset /T
```

Alternately, you can run calibre as Administrator, but doing so will cause some functionality, such as drag and drop to not work.

Finally, some users have reported that disabling UAC fixes the problem.

### 9.4.7 calibre is not starting/crashing on macOS?

One common cause of failures on macOS is the use of accessibility technologies that are incompatible with the graphics toolkit calibre uses. Try turning off VoiceOver if you have it on. Also go to System Preferences->System->Universal Access and turn off the setting for enabling access for assistive devices in all the tabs. Another cause can be some third party apps that modify system behavior, such as Smart Scroll.

You can obtain debug output about why calibre is not starting by running `Console.app`. Debug output will be printed to it. If the debug output contains a line that looks like:

```
Qt: internal: -108: Error ATSUMeasureTextImage text/qfontengine_mac.mm
```

then the problem is probably a corrupted font cache. You can clear the cache by following these instructions. If that doesn’t solve it, look for a corrupted font file on your system, in ~/Library/Fonts or the like. An easy way to check for corrupted fonts in macOS is to start the “Font Book” application, select all fonts and then in the File menu, choose “Validate fonts”.

### 9.4.8 I downloaded the installer, but it is not working?

Downloading from the Internet can sometimes result in a corrupted download. If the calibre installer you downloaded is not opening, try downloading it again. If re-downloading it does not work, download it from an alternate location.

If the installer still doesn’t work, then something on your computer is preventing it from running.

- Try temporarily disabling your antivirus program (Microsoft Security Essentials, or Kaspersky or Norton or McAfee or whatever). This is most likely the culprit if the upgrade process is hanging in the middle.
- Try rebooting your computer and running a registry cleaner like Wise registry cleaner.
- Try a clean install. That is, uninstall calibre, delete C:\Program Files\Calibre2 (or wherever you previously chose to install calibre). Then re-install calibre. Note that uninstalling does not touch your books or settings.
- Try downloading the installer with an alternate browser. For example if you are using Internet Explorer, try using Firefox or Chrome instead.
- If you get an error about a missing DLL on Windows, then most likely, the permissions on your temporary folder are incorrect. Go to the folder C:\Users\USERNAME\AppData\Local in Windows explorer and then right click on the Temp folder and select Properties and go to the Security tab. Make sure that your user account has full control for this folder.

---

67 [https://www.macworld.com/article/1139383/fontcache-clear.html](https://www.macworld.com/article/1139383/fontcache-clear.html)
68 [https://github.com/kovidgoyal/calibre/releases/latest](https://github.com/kovidgoyal/calibre/releases/latest)
69 [https://www.wisecleaner.com](https://www.wisecleaner.com)
If you still cannot get the installer to work and you are on Windows, you can use the calibre portable install\textsuperscript{70}, which does not need an installer (it is just a zip file).

\subsection*{9.4.9 My antivirus program claims calibre is a virus/trojan?}

The first thing to check is that you are downloading calibre from the official website: \url{https://calibre-ebook.com/download}. Make sure you are clicking the download links on the left, not the advertisements on the right. calibre is a very popular program and unscrupulous people try to setup websites offering it for download to fool the unwary.

If you have the official download and your antivirus program is still claiming calibre is a virus, then, your antivirus program is wrong. Antivirus programs use heuristics, patterns of code that “look suspicious” to detect viruses. It's rather like racial profiling. calibre is a completely open source product. You can actually browse the source code yourself (or hire someone to do it for you) to verify that it is not a virus. Please report the false identification to whatever company you buy your antivirus software from. If the antivirus program is preventing you from downloading/installing calibre, disable it temporarily, install calibre and then re-enable it.

\subsection*{9.4.10 How do I backup calibre?}

The most important thing to backup is the calibre library folder, that contains all your books and metadata. This is the folder you chose for your calibre library when you ran calibre for the first time. You can get the path to the library folder by clicking the calibre icon on the main toolbar. You must backup this complete folder with all its files and sub-folders.

You can switch calibre to using a backed up library folder by simply clicking the calibre icon on the toolbar and choosing your backup library folder. A backed up library folder backs up your custom columns and saved searches as well as all your books and metadata.

If you want to backup the calibre configuration/plugins, you have to backup the config directory. You can find this config directory via preferences\rightarrow miscellaneous. Note that restoring configuration directories is not officially supported, but should work in most cases. Just copy the contents of the backup directory into the current configuration directory to restore.

\subsection*{9.4.11 How do I use purchased EPUB books with calibre (or what do I do with .acsm files)?}

Most purchased EPUB books have DRM\textsuperscript{71}. This prevents calibre from opening them. You can still use calibre to store and transfer them to your e-book reader. First, you must authorize your reader on a windows machine with Adobe Digital Editions. Once this is done, EPUB books transferred with calibre will work fine on your reader. When you purchase an epub book from a website, you will get an “.acsm” file. This file should be opened with Adobe Digital Editions, which will then download the actual “.epub” e-book. The e-book file will be stored in the folder “My Digital Editions”, from where you can add it to calibre.

\subsection*{9.4.12 I am getting a “Permission Denied” error?}

A permission denied error can occur because of many possible reasons, none of them having anything to do with calibre.

\begin{itemize}
  \item You can get permission denied errors if you are using an SD card with write protect enabled.
  \item If you, or some program you used changed the file permissions of the files in question to read only.
\end{itemize}

\begin{footnotes}
\item[70] \url{https://calibre-ebook.com/download_portable}
\item[71] \url{https://drmfree.calibre-ebook.com/about#drm}
\end{footnotes}
• If there is a filesystem error on the device which caused your operating system to mount the filesystem in read only mode or mark a particular file as read only pending recovery.

• If the files have their owner set to a user other than you.

• If your file is open in another program.

• If the file resides on a device, you may have reached the limit of a maximum of 256 files in the root of the device. In this case you need to reformat the device/sd card referred to in the error message with a FAT32 filesystem, or delete some files from the SD card/device memory.

You will need to fix the underlying cause of the permissions error before resuming to use calibre. Read the error message carefully, see what file it points to and fix the permissions on that file or its containing folders.

9.4.13 Can I have the comment metadata show up on my reader?

Most readers do not support this. You should complain to the manufacturer about it and hopefully if enough people complain, things will change. In the meantime, you can insert the metadata, including comments into a “Jacket page” at the start of the e-book, by using the option to “Insert metadata as page at start of book” during conversion. The option is found in the Structure detection section of the conversion settings. Note that for this to have effect you have to convert the book. If your book is already in a format that does not need conversion, you can convert from that format to the same format.

Another alternative is to create a catalog in e-book form containing a listing of all the books in your calibre library, with their metadata. Click-and-hold the Convert button to access the catalog creation tool. And before you ask, no you cannot have the catalog “link directly to” books on your reader.

9.4.14 How do I get calibre to use my HTTP proxy?

By default, calibre uses whatever proxy settings are set in your OS. Sometimes these are incorrect, for example, on Windows if you don’t use Internet Explorer then the proxy settings may not be up to date. You can tell calibre to use a particular proxy server by setting the http_proxy and https_proxy environment variables. The format of the variable is: http://username:password@servername you should ask your network administrator to give you the correct value for this variable. Note that calibre only supports HTTP proxies not SOCKS proxies. You can see the current proxies used by calibre in Preferences->Miscellaneous.

9.4.15 I want some feature added to calibre. What can I do?

You have two choices:

1. Create a patch by hacking on calibre and send it to me for review and inclusion. See Development.

2. Open a bug requesting the feature. Remember that while you may think your feature request is extremely important/essential, calibre developers might not agree. Fortunately, calibre is open source, which means you always have the option of implementing your feature yourself, or hiring someone to do it for you. Furthermore, calibre has a comprehensive plugin architecture, so you might be able to develop your feature as a plugin, see Writing your own plugins to extend calibre’s functionality.

9.4.16 Why doesn’t calibre have an automatic update?

For many reasons:

---

72 [https://calibre-ebook.com/get-involved](https://calibre-ebook.com/get-involved)
73 [https://calibre-ebook.com/bugs](https://calibre-ebook.com/bugs)
• *There is no need to update every week.* If you are happy with how calibre works turn off the update notification and be on your merry way. Check back to see if you want to update once a year or so. There is a check box to turn off the update notification, on the update notification itself.

• calibre downloads currently use about 100TB of bandwidth a month. Implementing automatic updates would greatly increase that and end up costing thousands of dollars a month, which someone has to pay.

• If I implement a dialog that downloads the update and launches it, instead of going to the website as it does now, that would save the most ardent calibre updater, at most five clicks a week. There are far higher priority things to do in calibre development.

• If you really, really hate downloading calibre every week but still want to be up to the latest, I encourage you to run from source, which makes updating trivial. Instructions are available here (page 321).

• There are third party automatic updaters for calibre made by calibre users in the calibre forum.

9.4.17 How is calibre licensed?

calibre is licensed under the GNU General Public License v3 (an open source license). This means that you are free to redistribute calibre as long as you make the source code available. So if you want to put calibre on a CD with your product, you must also put the calibre source code on the CD. The source code is available for download. You are free to use the results of conversions from calibre however you want. You cannot use either code or libraries from calibre in your software without making your software open source. For details, see The GNU GPL v3.

9.4.18 How do I run calibre from my USB stick?

A portable version of calibre is available here.

9.4.19 How do I run parts of calibre like news download and the Content server on my own linux server?

First, you must install calibre onto your Linux server. If your server is using a modern Linux distribution, you should have no problems installing calibre onto it.

Note: calibre needs GLIBC >= 2.17 and libstdc++ >= 6.0.17. If you have an older server, you will either need to compile these from source, or use calibre 2.85.1 which requires GLIBC >= 2.13 or calibre 1.48 which requires only GLIBC >= 2.10. In addition, although the calibre command line utilities do not need a running X server, some of them do require the X server libraries to be installed on your system. This is because of Qt, which is used for various image processing tasks, and links against these libraries. If you get an ImportError about some Qt modules, you are likely missing some X libraries.

You can run the calibre server via the command:

```
/opt/calibre/calibre-server /path/to/the/library/you/want/to/share
```

You can download news and convert it into an e-book with the command:

```
```

---

74 [https://calibre-ebook.com/dynamic/downloads](https://calibre-ebook.com/dynamic/downloads)
76 [https://download.calibre-ebook.com](https://download.calibre-ebook.com)
77 [https://www.gnu.org/licenses/gpl.html](https://www.gnu.org/licenses/gpl.html)
78 [https://calibre-ebook.com/download_portable](https://calibre-ebook.com/download_portable)
If you want to generate MOBI, use outputfile.mobi instead and use `--output-profile kindle`.

You can email downloaded news with the command:

```
/opt/calibre/calibre-smtp
```

I leave figuring out the exact command line as an exercise for the reader.

Finally, you can add downloaded news to the calibre library with:

```
/opt/calibre/calibredb add --with-library /path/to/library outputfile.epub
```

Remember to read the *Command Line Interface* (page 271) section of the calibre User Manual to learn more about these, and other commands.
Here you will find tutorials to get you started using calibre’s more advanced features, such as XPath and templates.

10.1 Managing subgroups of books, for example “genre”

Some people wish to organize the books in their library into subgroups, similar to subfolders. The most commonly provided reason is to create genre hierarchies, but there are many others. One user asked for a way to organize textbooks by subject and course number. Another wanted to keep track of gifts by subject and recipient. This tutorial will use the genre example for the rest of this post.

Before going on, please note that we are not talking about folders on the hard disk. Subgroups are not file folders. Books will not be copied anywhere. calibre’s library file structure is not affected. Instead, we are presenting a way to organize and display subgroups of books within a calibre library.

- Setup (page 155)
- Searching (page 157)
- Restrictions (page 158)
- Useful template functions (page 158)

The commonly-provided requirements for subgroups such as genres are:

- A subgroup (e.g., a genre) must contain (point to) books, not categories of books. This is what distinguishes subgroups from calibre user categories.
- A book can be in multiple subgroups (genres). This distinguishes subgroups from physical file folders.
- Subgroups (genres) must form a hierarchy; subgroups can contain subgroups.

Tags give you the first two. If you tag a book with the genre then you can use the Tag browser (or search) for find the books with that genre, giving you the first. Many books can have the same tag(s), giving you the second. The problem is that tags don’t satisfy the third requirement. They don’t provide a hierarchy.
The calibre hierarchy feature gives you the third – the ability to see the genres in a ‘tree’ and the ability to easily search for books in genre or sub-genre. For example, assume that your genre structure is similar to the following:

```
Genre
  . History
    .. Japanese
    .. Military
    .. Roman
  . Mysteries
  .. English
  .. Vampire
  . Science Fiction
    .. Alternate History
    .. Military
    .. Space Opera
  . Thrillers
  .. Crime
  .. Horror
  etc.
```

By using the hierarchy feature, you can see these genres in the Tag browser in tree form, as shown in the screen image. In this example the outermost level (Genre) is a custom column that contains the genres. Genres containing sub-genres appear with a small triangle next to them. Clicking on that triangle will open the item and show the sub-genres, as you can see with History and Science Fiction.

Clicking on a genre can search for all books with that genre or children of that genre. For example, clicking on Science Fiction can give all three of the child genres, Alternate History, Military, and Space Opera. Clicking on Alternate History will give books in that genre, ignoring those in Military and Space Opera. Of course, a book can have multiple genres. If a book has both Space Opera and Military genres, then you will see that book if you click on either genre. Searching is discussed in more detail below.

Another thing you can see from the image is that the genre Military appears twice, once under History and once under Science Fiction. Because the genres are in a hierarchy, these are two separate genres. A book can be in one, the other, or (doubtfully in this case) both. For example, the books in Winston Churchill’s “The Second World War” could be in
“History.Military”. David Weber’s Honor Harrington books could be in “Science Fiction.Military”, and for that matter also in “Science Fiction.Space Opera.”

Once a genre exists, that is at least one book has that genre, you can easily apply it to other books by dragging the books from the library view onto the genre you want the books to have. You can also apply genres in the metadata editors; more on this below.

### 10.1.1 Setup

By now, your question might be “How was all of this setup?” There are three steps: 1) create the custom column, 2) tell calibre that the new column is to be treated as a hierarchy, and 3) add genres.

You create the custom column in the usual way, using Preferences -> Add your own columns. This example uses “#genre” as the lookup name and “Genre” as the column heading. The column type is “Comma-separated text, like tags, shown in the Tag browser.”

![Create a custom column](image)

Then after restarting calibre, you must tell calibre that the column is to be treated as a hierarchy. Go to Preferences → Look & feel → Tag browser and enter the lookup name “#genre” into the “Categories with hierarchical items” box. Press Apply, and you are done with setting up.
At the point there are no genres in the column. We are left with the last step: how to apply a genre to a book. A genre does not exist in calibre until it appears on at least one book. To learn how to apply a genre for the first time, we must go into some detail about what a genre looks like in the metadata for a book.

A hierarchy of ‘things’ is built by creating an item consisting of phrases separated by periods. Continuing the genre example, these items would “History.Military”, “Mysteries.Vampire”, “Science Fiction.Space Opera”, etc. Thus to create a new genre, you pick a book that should have that genre, edit its metadata, and enter the new genre into the column you created. Continuing our example, if you want to assign a new genre “Comics” with a sub-genre “Superheroes” to a book, you would ‘edit metadata’ for that (comic) book, choose the Custom metadata tab, and then enter “Comics.Superheroes” as shown in the following (ignore the other custom columns):

After doing the above, you see in the Tag browser:
From here on, to apply this new genre to a book (a comic book, presumably), you can either drag the book onto the genre, or add it to the book using edit metadata in exactly the same way as done above.

**Note:** Hierarchical display only works if the Tag browser is set to sort items by name. This is the default and can be checked by clicking the *Configure* button at the bottom of the Tag browser.

### 10.1.2 Searching

The easiest way to search for genres is using the Tag browser, clicking on the genre you wish to see. Clicking on a genre with children will show you books with that genre and all child genres. However, this might bring up a question. Just because a genre has children doesn’t mean that it isn’t a genre in its own right. For example, a book can have the genre “History” but not “History.Military”. How do you search for books with only “History”?

The Tag browser search mechanism knows if an item has children. If it does, clicking on the item cycles through 5 searches instead of the normal three. The first is the normal green plus, which shows you books with that genre only (e.g., History). The second is a doubled plus (shown above), which shows you books with that genre and all sub-genres (e.g., History and History.Military). The third is the normal red minus, which shows you books without that exact genre. The fourth is a doubled minus, which shows you books without that genre or sub-genres. The fifth is back to the beginning, no mark, meaning no search.
10.1.3 Restrictions

If you search for a genre then create a saved search for it, you can use the ‘restrict to’ box to create a virtual library of books with that genre. This is useful if you want to do other searches within the genre or to manage/update metadata for books in the genre. Continuing our example, you can create a saved search named ‘History.Japanese’ by first clicking on the genre Japanese in the Tag browser to get a search into the search box, entering History.Japanese into the saved search box, then pushing the “save search” button (the green box with the white plus, on the right-hand side).

After creating the saved search, you can use it as a restriction.

10.1.4 Useful template functions

You might want to use the genre information in a template, such as with save to disk or send to device. The question might then be “How do I get the outermost genre name or names?” A calibre template function, subitems, is provided to make doing this easier.

For example, assume you want to add the outermost genre level to the save-to-disk template to make genre folders, as in “History/The Gathering Storm - Churchill, Winston”. To do this, you must extract the first level of the hierarchy and add it to the front along with a slash to indicate that it should make a folder. The template below accomplishes this:

```
(#genre:subitems(0,1)||/){title} - {authors}
```

See The template language (page 161) for more information about templates and the subitems() function.
10.2 XPath tutorial

In this tutorial, you will be given a gentle introduction to XPath, a query language that can be used to select arbitrary parts of HTML documents in calibre. XPath is a widely used standard, and googling it will yield a ton of information. This tutorial, however, focuses on using XPath for e-book related tasks like finding chapter headings in an unstructured HTML document.

### Contents

- Selecting by tag name (page 159)
- Selecting by attributes (page 160)
- Selecting by tag content (page 160)
- Sample e-book (page 160)
- XPath built-in functions (page 160)

#### 10.2.1 Selecting by tag name

The simplest form of selection is to select tags by name. For example, suppose you want to select all the `<h2>` tags in a document. The XPath query for this is simply:

```
//h:h2  (Selects all <h2> tags)
```

The prefix `//` means search at any level of the document. Now suppose you want to search for `<span>` tags that are inside `<a>` tags. That can be achieved with:

```
//h:a/h:span  (Selects <span> tags inside <a> tags)
```

If you want to search for tags at a particular level in the document, change the prefix:

```
/h:body/h:div/h:p  (Selects <p> tags that are children of <div> tags that are children of the <body> tag)
```

This will match only `<p>` tags. A very short e-book to demonstrate the use of XPath. `<p>` in the Sample e-book (page 160) but not any of the other `<p>` tags. The `h:` prefix in the above examples is needed to match XHTML tags. This is because internally, calibre represents all content as XHTML. In XHTML tags have a namespace, and `h:` is the namespace prefix for HTML tags.

Now suppose you want to select both `<h1>` and `<h2>` tags. To do that, we need a XPath construct called *predicate*. A predicate is simply a test that is used to select tags. Tests can be arbitrarily powerful and as this tutorial progresses, you will see more powerful examples. A predicate is created by enclosing the test expression in square brackets:

```
//*[name()='h1' or name()='h2']
```

There are several new features in this XPath expression. The first is the use of the wildcard `*`. It means *match any tag*. Now look at the test expression `name()='h1' or name()='h2'`. `name()` is an example of a *built-in function*. It simply evaluates to the name of the tag. So by using it, we can select tags whose names are either `h1` or `h2`. Note that the `name()` function ignores namespaces so that there is no need for the `h:` prefix. XPath has several useful built-in functions. A few more will be introduced in this tutorial.

---

79 https://en.wikipedia.org/wiki/XPath  
80 https://en.wikipedia.org/wiki/HTML
10.2.2 Selecting by attributes

To select tags based on their attributes, the use of predicates is required:

\[//[@style] \] (Select all tags that have a style attribute)
\[//[@class="chapter"] \] (Select all tags that have class="chapter")
\[/h:h1[@class="bookTitle"] \] (Select all h1 tags that have class="bookTitle")

Here, the @ operator refers to the attributes of the tag. You can use some of the XPath built-in functions (page 160) to perform more sophisticated matching on attribute values.

10.2.3 Selecting by tag content

Using XPath, you can even select tags based on the text they contain. The best way to do this is to use the power of regular expressions via the built-in function \texttt{re:test}():

\[//h:h2[re:test(., 'chapter|section', 'i')] \] (Selects <h2> tags that contain the words "chapter" or "section")

Here the . operator refers to the contents of the tag, just as the @ operator referred to its attributes.

10.2.4 Sample e-book

```html
<html>
<head>
  <title>A very short e-book</title>
  <meta name="charset" value="utf-8" />
</head>
<body>
  <h1 class="bookTitle">A very short e-book</h1>
  <p style="text-align:right">Written by Kovid Goyal</p>
  <div class="introduction">
    <p>A very short e-book to demonstrate the use of XPath.</p>
  </div>
  <h2 class="chapter">Chapter One</h2>
  <p>This is a truly fascinating chapter.</p>
  <h2 class="chapter">Chapter Two</h2>
  <p>A worthy continuation of a fine tradition.</p>
</body>
</html>
```

10.2.5 XPath built-in functions

\texttt{name()} The name of the current tag.
\texttt{contains(s1, s2)} returns \texttt{true} if \texttt{s1} contains \texttt{s2}.
\texttt{re:test(src, pattern, flags)} returns \texttt{true} if the string \texttt{src} matches the regular expression \texttt{pattern}. A particularly useful flag is \texttt{i}, it makes matching case insensitive. A good primer on the syntax for regular expressions can be found at regexp syntax\textsuperscript{81}

\textsuperscript{81} https://docs.python.org/2.7/library/re.html
10.3 The calibre template language

The calibre template language is used in various places. It is used to control the folder structure and file name when saving files from the calibre library to the disk or e-book reader. It is also used to define “virtual” columns that contain data from other columns and so on.

The basic template language is very simple, but has very powerful advanced features. The basic idea is that a template consists of text and names in curly brackets that are then replaced by the corresponding metadata from the book being processed. So, for example, the default template used for saving books to device in calibre is:

```
{author_sort}/{title}/{title} - {authors}
```

For the book “The Foundation” by “Isaac Asimov” it will become:

```
Asimov, Isaac/The Foundation/The Foundation - Isaac Asimov
```

The slashes are text, which is put into the template where it appears. For example, if your template is:

```
{author_sort} Some Important Text {title}/{title} - {authors}
```

For the book “The Foundation” by “Isaac Asimov” it will become:

```
Asimov, Isaac Some Important Text The Foundation/The Foundation - Isaac Asimov
```

You can use all the various metadata fields available in calibre in a template, including any custom columns you have created yourself. To find out the template name for a column simply hover your mouse over the column header. Names for custom fields (columns you have created yourself) always have a # as the first character. For series type custom fields, there is always an additional field named #seriesname_index that becomes the series index for that series. So if you have a custom series field named #myseries, there will also be a field named #myseries_index.

In addition to the column based fields, you also can use:

```
{formats} - A list of formats available in the calibre library for a book
{identifiers:select(isbn)} - The ISBN of the book
```

If a particular book does not have a particular piece of metadata, the field in the template is automatically removed for that book. Consider, for example:

```
{author_sort}/{series}/{title} {series_index}
```

If a book has a series, the template will produce:

```
Asimov, Isaac/Foundation/Second Foundation 3
```

and if a book does not have a series:

```
Asimov, Isaac/Second Foundation
```

(calibre automatically removes multiple slashes and leading or trailing spaces).

10.3.1 Advanced formatting

You can do more than just simple substitution with the templates. You can also conditionally include text and control how the substituted data is formatted.
First, conditionally including text. There are cases where you might want to have text appear in the output only if a field is not empty. A common case is series and series_index, where you want either nothing or the two values with a hyphen between them. calibre handles this case using a special field syntax.

For example, assume you want to use the template:

\[ \{\text{series}\} - \{\text{series\_index}\} - \{\text{title}\} \]

If the book has no series, the answer will be \(- - \text{title}\). Many people would rather the result be simply title, without the hyphens. To do this, use the extended syntax \(\{\text{field:|prefix\_text|suffix\_text}\}\). When you use this syntax, if field has the value SERIES then the result will be \text{prefix\_textSERIESsuffix\_text}. If field has no value, then the result will be the empty string (nothing); the prefix and suffix are ignored. The prefix and suffix can contain blanks. Do not use subtemplates (\{ ... \}) or functions (see below) as the prefix or the suffix.

Using this syntax, we can solve the above series problem with the template:

\[ \{\text{series}\}\{\text{series\_index:| - | -}\}\{\text{title}\} \]

The hyphens will be included only if the book has a series index, which it will have only if it has a series.

Notes: you must include the : character if you want to use a prefix or a suffix. You must either use no | characters or both of them; using one, as in \(\{\text{field:| - }\}\), is not allowed. It is OK not to provide any text for one side or the other, such as in \(\{\text{series:|| - }\}\). Using \(\{\text{title:||}\}\) is the same as using \(\{\text{title}\}\).

Second: formatting. Suppose you wanted to ensure that the series_index is always formatted as three digits with leading zeros. This would do the trick:

\[ \{\text{series\_index:0>3s}\} - \text{Three digits with leading zeros} \]

If instead of leading zeros you want leading spaces, use:

\[ \{\text{series\_index:>3s}\} - \text{Three digits with leading spaces} \]

For trailing zeros, use:

\[ \{\text{series\_index:0<3s}\} - \text{Three digits with trailing zeros} \]

If you use series indices with sub values (e.g., 1.1), you might want to ensure that the decimal points line up. For example, you might want the indices 1 and 2.5 to appear as 01.00 and 02.50 so that they will sort correctly. To do this, use:

\[ \{\text{series\_index:0>5.2f}\} - \text{Five characters, consisting of two digits with leading zeros, a decimal point, then 2 digits after the decimal point} \]

If you want only the first two letters of the data, use:

\[ \{\text{author\_sort:.2}\} - \text{Only the first two letter of the author sort name} \]

The calibre template language comes from Python and for more details on the syntax of these advanced formatting operations, look at the Python documentation\(^{82}\).

\(^{82}\) \url{https://docs.python.org/2/library/string.html#format-string-syntax}
10.3.2 Advanced features

10.3.3 Using templates in custom columns

There are sometimes cases where you want to display metadata that calibre does not normally display, or to display data in a way different from how calibre normally does. For example, you might want to display the ISBN, a field that calibre does not display. You can use custom columns for this by creating a column with the type ‘column built from other columns’ (hereafter called composite columns), and entering a template. Result: calibre will display a column showing the result of evaluating that template. To display the ISBN, create the column and enter 

{identifiers:select(isbn)}

into the template box. To display a column containing the values of two series custom columns separated by a comma, use 

{#series1:||,}{#series2}.

Composite columns can use any template option, including formatting.

You cannot change the data contained in a composite column. If you edit a composite column by double-clicking on any item, you will open the template for editing, not the underlying data. Editing the template on the GUI is a quick way of testing and changing composite columns.

10.3.4 Using functions in templates - single-function mode

Suppose you want to display the value of a field in upper case, when that field is normally in title case. You can do this (and many more things) using the functions available for templates. For example, to display the title in upper case, use 

{title:uppercase()}

To display it in title case, use 

{title:titlecase()}

Function references appear in the format part, going after the : and before the first | or the closing }. If you have both a format and a function reference, the function comes after another :. Functions must always end with (). Some functions take extra values (arguments), and these go inside the ()

Functions are always applied before format specifications. See further down for an example of using both a format and a function, where this order is demonstrated.

The syntax for using functions is 

{field:function(arguments)}

or 

{field:function(arguments)|prefix|suffix}. Arguments are separated by commas. Commas inside arguments must be preceded by a backslash ( \ ). The last (or only) argument cannot contain a closing parenthesis ( )). Functions return the value of the field used in the template, suitably modified.

Important: If you have programming experience, please note that the syntax in this mode (single function) is not what you might expect. Strings are not quoted. Spaces are significant. All arguments must be constants; there is no sub-evaluation. Do not use subtemplates (‘{ … }’) as function arguments. Instead, use template program mode (page 166) and general program mode (page 189).

Many functions use regular expressions. In all cases, regular expression matching is case-insensitive.

The functions available are listed below. Note that the definitive documentation for functions is available in the section Function classification (page 171):

- lowercase() – return value of the field in lower case.
- uppercase() – return the value of the field in upper case.
- titlecase() – return the value of the field in title case.
- capitalize() – return the value with the first letter upper case and the rest lower case.
- contains(pattern, text if match, text if not match) – checks if field contains matches for the regular expression pattern. Returns text if match if matches are found, otherwise it returns text if no match.
• **count(separator)** – interprets the value as a list of items separated by *separator*, returning the number of items in the list. Most lists use a comma as the separator, but authors use an ampersand. Examples: `{tags:count(.)}, {authors:count(&)}`

• **format_number(template)** – interprets the field as a number and format that number using a Python formatting template such as `{0:5.2f}` or `{0:d}` or `{0:5,.2f}`. The field_name part of the template must be a 0 (zero) (the `{0:` in the above examples). You can leave off the leading `{0:` and trailing `}`” if the template contains only a format. See the template language and Python documentation for more examples. Returns the empty string if formatting fails.

• **human_readable()** – expects the value to be a number and returns a string representing that number in KB, MB, GB, etc.

• **ifempty(text)** – if the field is not empty, return the value of the field. Otherwise return *text*.

• **in_list(separator, pattern, found_val, ..., not_found_val)** – interpret the field as a list of items separated by *separator*, evaluating the *pattern* against each value in the list. If the *pattern* matches a value, return *found_val*, otherwise return *not_found_val*. The *pattern* and *found_value* can be repeated as many times as desired, permitting returning different values depending on the search. The patterns are checked in order. The first match is returned.

• **language_codes(lang_strings)** – return the language codes for the strings passed in *lang_strings*. The strings must be in the language of the current locale. *Lang_strings* is a comma-separated list.

• **language_strings(lang_codes, localize)** – return the strings for the language codes passed in *lang_codes*. If localize is zero, return the strings in English. If localize is not zero, return the strings in the language of the current locale. *Lang_codes* is a comma-separated list.

• **list_item(index, separator)** – interpret the field as a list of items separated by *separator*, returning the *index*’th item. The first item is number zero. The last item can be returned using `list_item(-1,separator)`. If the item is not in the list, then the empty value is returned. The separator has the same meaning as in the *count* function.

• **lookup(pattern, field, pattern, field, ..., else_field)** – like switch, except the arguments are field (metadata) names, not text. The value of the appropriate field will be fetched and used. Note that because composite columns are fields, you can use this function in one composite field to use the value of some other composite field. This is extremely useful when constructing variable save paths (more later).

• **re(pattern, replacement)** – return the field after applying the regular expression. All instances of *pattern* are replaced with *replacement*. As in all of calibre, these are Python-compatible regular expressions.

• **select(key)** – interpret the field as a comma-separated list of items, with the items being of the form “id:value”. Find the pair with the id equal to key, and return the corresponding value. This function is particularly useful for extracting a value such as an isbn from the set of identifiers for a book.

• **shorten(left chars, middle text, right chars)** – Return a shortened version of the field, consisting of left chars characters from the beginning of the field, followed by middle text, followed by right chars characters from the end of the string. Left chars and right chars must be integers. For example, assume the title of the book is *Ancient English Laws in the Times of Ivanhoe*, and you want it to fit in a space of at most 15 characters. If you use `{title:shorten(9,-,5)}`, the result will be *Ancient E-nhoe*. If the field’s length is less than left chars + right chars + the length of middle text, then the field will be used intact. For example, the title *The Dome* would not be changed.

• **str_in_list(separator, string, found_val, ..., not_found_val)** – interpret the field as a list of items separated by *separator*, comparing the *string* against each value in the list. If the *string* matches a value (ignoring case), return *found_val*, otherwise return *not_found_val*. If the string contains separators, then it is also treated as a list and each value is checked. The *string* and *found_value* can be repeated as many times as desired, permitting returning different values depending on the search. The strings are checked in order. The first match is returned.
• **subitems(start_index, end_index)** – This function is used to break apart lists of tag-like hierarchical items such as genres. It interprets the field as a comma-separated list of tag-like items, where each item is a period-separated list. Returns a new list made by first finding all the period-separated tag-like items, then for each such item extracting the components from `start_index` to `end_index`, then combining the results back together. The first component in a period-separated list has an index of zero. If an index is negative, then it counts from the end of the list. As a special case, an `end_index` of zero is assumed to be the length of the list. Examples:

<table>
<thead>
<tr>
<th>Assuming a <code>#genre</code> column containing &quot;A.B.C&quot;:</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>{#genre:subitems(0,1)}</code> returns &quot;A&quot;</td>
</tr>
<tr>
<td><code>{#genre:subitems(0,2)}</code> returns &quot;A.B&quot;</td>
</tr>
<tr>
<td><code>{#genre:subitems(1,0)}</code> returns &quot;B.C&quot;</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Assuming a <code>#genre</code> column containing &quot;A.B.C, D.E&quot;:</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>{#genre:subitems(0,1)}</code> returns &quot;A, D&quot;</td>
</tr>
<tr>
<td><code>{#genre:subitems(0,2)}</code> returns &quot;A.B, D.E&quot;</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>• <strong>sublist(start_index, end_index, separator)</strong> – interpret the field as a list of items separated by <code>separator</code>, returning a new list made from the items from <code>start_index</code> to <code>end_index</code>. The first item is number zero. If an index is negative, then it counts from the end of the list. As a special case, an <code>end_index</code> of zero is assumed to be the length of the list. Examples assuming that the tags column (which is comma-separated) contains “A, B, C”:</th>
</tr>
</thead>
<tbody>
<tr>
<td>`{tags:sublist(0,1,,)} returns &quot;A&quot;</td>
</tr>
<tr>
<td>`{tags:sublist(-1,0,,)} returns &quot;C&quot;</td>
</tr>
<tr>
<td>`{tags:sublist(0,-1,,)} returns &quot;A, B&quot;</td>
</tr>
</tbody>
</table>

• **swap_around_comma()** – given a field with a value of the form `B, A`, return `A, B`. This is most useful for converting names in LN, FN format to FN LN. If there is no comma, the function returns `val unchanged`.

• **switch(pattern, value, pattern, value, ..., else_value)** – for each `pattern, value` pair, checks if the field matches the regular expression `pattern` and if so, returns that `value`. If no `pattern` matches, then `else_value` is returned. You can have as many `pattern, value` pairs as you want.

• **test(text if not empty, text if empty)** – return `text if not empty` if the field is not empty, otherwise return `text if empty`.

• **transliterate()** – Returns a string in a latin alphabet formed by approximating the sound of the words in the source field. For example, if the source field is Фёдор Михайлович Достоевский the function returns Fiodor Mikhailovich Dostoievskii.

Now, what about using functions and formatting in the same field. Suppose you have an integer custom column called `#myint` that you want to see with leading zeros, as in 003. To do this, you would use a format of `0>3s`. However, by default, if a number (integer or float) equals zero then the field produces the empty value, so zero values will produce nothing, not 000. If you really want to see 000 values, then you use both the format string and the `ifempty` function to change the empty value back to a zero. The field reference would be:

```
{#myint:0>3s:ifempty(0)}
```

Note that you can use the prefix and suffix as well. If you want the number to appear as [003] or [000], then use the field:

```
{#myint:0>3s:ifempty(0)||||}
```
10.3.5 Using functions in templates - template program mode

The template language program mode differs from single-function mode in that it permits you to write template expres-
sions that refer to other metadata fields, modify values, and do arithmetic. It is a reasonably complete programming
language.

You can use the functions documented above in template program mode. See below for details.

Beginning with an example, assume that you want your template to show the series for a book if it has one, otherwise
show the value of a custom field #genre. You cannot do this in the basic language because you cannot make reference
to another metadata field within a template expression. In program mode, you can. The following expression works:

```
{#series:'ifempty($, field('#genre'))'}
```

The example shows several things:

- program mode is used if the expression begins with `:` and ends with `. Anything else is assumed to be
  single-function.
- the variable $ stands for the field the expression is operating upon, #series in this case.
- functions must be given all their arguments. There is no default value. For example, the standard built-in func-
tions must be given an additional initial parameter indicating the source field, which is a significant difference
from single-function mode.
- white space is ignored and can be used anywhere within the expression.
- constant strings are enclosed in matching quotes, either `'` or `"`.

The language is similar to functional languages in that it is built almost entirely from functions. A statement is
a function. An expression is a function. Constants and identifiers can be thought of as functions returning the value
indicated by the constant or stored in the identifier.

The syntax of the language is shown by the following grammar:

```
class constant ::= " string " | ' string ' | number
identifier ::= sequence of letters or `_' characters
function ::= identifier ( statement [ , statement ]* )
expression ::= identifier | constant | function | assignment
assignment ::= identifier '=' expression
statement ::= expression [ ; expression ]*
program ::= statement
```

Comments are lines with a `#` character at the beginning of the line.

An expression always has a value, either the value of the constant, the value contained in the identifier, or the value
returned by a function. The value of a statement is the value of the last expression in the sequence of statements.
As such, the value of the program (statement):

```
1; 2; 'foobar'; 3
```

is 3.

Another example of a complex but rather silly program might help make things clearer:

```
{series_index:

   substr(
      strcat($, '|->'),
      cmp(divide($, 2), 1,
          assign(c, 1); substr('lt123', c, 0),
          'eq', 'gt')))
```
This program does the following:

- specify that the field being looked at is `series_index`. This sets the value of the variable `$`.
- calls the `substr` function, which takes 3 parameters: `(str, start, end)`. It returns a string formed by extracting the start through end characters from string, zero-based (the first character is character zero). In this case the string will be computed by the `strcat` function, the start is 0, and the end is 6. In this case it will return the first 6 characters of the string returned by `strcat`, which must be evaluated before `substr` can return.
- calls the `strcat` (string concatenation) function. `strcat` accepts 1 or more arguments, and returns a string formed by concatenating all the values. In this case there are three arguments. The first parameter is the value in `$`, which here is the value of `series_index`. The second parameter is the constant string `'->'`. The third parameter is the value returned by the `cmp` function, which must be fully evaluated before `strcat` can return.
  - The `cmp` function takes 5 arguments: `(x, y, lt, eq, gt)`. It compares `x` and `y` and returns the third argument `lt` if `x < y`, the fourth argument `eq` if `x == y`, and the fifth argument `gt` if `x > y`. As with all functions, all of the parameters can be statements. In this case the first parameter (the value for `x`) is the result of dividing `series_index` by 2. The second parameter `y` is the constant 1. The third parameter `lt` is a statement (more later). The fourth parameter `eq` is the constant string `'eq'`. The fifth parameter is the constant string `'gt'`.
  - The third parameter (the one for `lt`) is a statement, or a sequence of expressions. Remember that a statement (a sequence of semicolon-separated expressions) is also an expression, returning the value of the last expression in the list. In this case, the program first assigns the value 1 to a local variable `c`, then returns a substring made by extracting the `c`'th character to the end. Since `c` always contains the constant 1, the substring will return the second through end, 't123'.
  - Once the statement providing the value to the third parameter is executed, `cmp` can return a value. At that point, `strcat` can return a value, then `substr` can return a value. The program then terminates.

For various values of `series_index`, the program returns:

- `series_index == undefined`, result = `prefix ->t123 suffix`
- `series_index == 0.5`, result = `prefix 0.50-> suffix`
- `series_index == 1`, result = `prefix 1->t12 suffix`
- `series_index == 2`, result = `prefix 2->eq suffix`
- `series_index == 3`, result = `prefix 3->gt suffix`

**All the functions listed under single-function mode can be used in program mode.** To do so, you must supply the value that the function is to act upon as the first parameter, in addition to the parameters documented above. For example, in program mode the parameters of the `test` function are `test(x, text_if_not_empty, text_if_empty)`. The `x` parameter, which is the value to be tested, will almost always be a variable or a function call, often `field()`.

The following functions are available in addition to those described in single-function mode. Remember from the example above that the single-function mode functions require an additional first parameter specifying the field to operate on. With the exception of the `id` parameter of `assign`, all parameters can be statements (sequences of expressions). Note that the definitive documentation for functions is available in the section `Function classification` (page 171):

- `and(value, value, ...)` – returns the string “1” if all values are not empty, otherwise returns the empty string. This function works well with `test` or `first_non_empty`. You can have as many values as you want.
- `add(x, y)` – returns `x + y`. Throws an exception if either `x` or `y` are not numbers.
- `assign(id, val)` – assigns `val` to `id`, then returns `val`. `id` must be an identifier, not an expression.
• **approximate_formats()** — return a comma-separated list of formats that at one point were associated with the book. There is no guarantee that the list is correct, although it probably is. This function can be called in template program mode using the template `{:'approximate_formats()'}`. Note that format names are always uppercase, as in EPUB.

• **author_links(val_separator, pair_separator)** — returns a string containing a list of authors and that author’s link values in the form author1 val_separator author1link pair_separator author2 val_separator author2link etc. An author is separated from its link value by the val_separator string with no added spaces. author:linkvalue pairs are separated by the pair_separator string argument with no added spaces. It is up to you to choose separator strings that do not occur in author names or links. An author is included even if the author link is empty.

• **author_sorts(val_separator)** — returns a string containing a list of author’s sort values for the authors of the book. The sort is the one in the author metadata (different from the author_sort in books). The returned list has the form author sort 1 val_separator author sort 2 etc. The author sort values in this list are in the same order as the authors of the book. If you want spaces around val_separator then include them in the separator string.

• **booksize()** — returns the value of the calibre ‘size’ field. Returns ‘’ if there are no formats.

• **cmp(x, y, lt, eq, gt)** — compares x and y after converting both to numbers. Returns lt if x < y. Returns eq if x == y. Otherwise returns gt.

• **current_library_name()** — return the last name on the path to the current calibre library. This function can be called in template program mode using the template `{:'current_library_name()'}`.

• **current_library_path()** — return the path to the current calibre library. This function can be called in template program mode using the template `{:'current_library_path()'}`.

• **days_between(date1, date2)** — return the number of days between date1 and date2. The number is positive if date1 is greater than date2, otherwise negative. If either date1 or date2 are not dates, the function returns the empty string.

• **divide(x, y)** — returns x / y. Throws an exception if either x or y are not numbers.

• **eval(string)** — evaluates the string as a program, passing the local variables (those assigned to). This permits using the template processor to construct complex results from local variables. Because the { and } characters are special, you must use [ and ] for the { character and } for the } character; they are converted automatically. Note also that prefixes and suffixes (the |prefix|suffix syntax) cannot be used in the argument to this function when using template program mode.

• **field(name)** — returns the metadata field named by name.

• **first_matching_cmp(val, cmp1, result1, cmp2, result2, ..., else_result)** — compares val < cmpN in sequence, returning resultN for the first comparison that succeeds. Returns else_result if no comparison succeeds. Example:

```
first_matching_cmp(10,5,"small",10,"middle",15,"large","giant")
```

returns “large”. The same example with a first value of 16 returns “giant”.

• **first_non_empty(value, value, ...)** — returns the first value that is not empty. If all values are empty, then the empty value is returned. You can have as many values as you want.

• **format_date(val, format_string)** — format the value, which must be a date field, using the format_string, returning a string. The formatting codes are:

```
d : the day as number without a leading zero (1 to 31)
dd : the day as number with a leading zero (01 to 31)
ddd : the abbreviated localized day name (e.g. "Mon" to "Sun")
```

(continues on next page)
dddd : the long localized day name (e.g. "Monday" to "Sunday").
M : the month as number without a leading zero (1 to 12).
MMM : the month as number with a leading zero (01 to 12)
MMMM : the abbreviated localized month name (e.g. "Jan" to "Dec").
MMMM : the long localized month name (e.g. "January" to "December").
yy : the year as two digit number (00 to 99).
yyyy : the year as four digit number.
h : the hours without a leading 0 (0 to 11 or 00 to 23, depending on am/pm)
hh : the hours with a leading 0 (00 to 11 or 00 to 23, depending on am/pm)
m : the minutes without a leading 0 (0 to 59)
mm : the minutes with a leading 0 (00 to 59)
s : the seconds without a leading 0 (0 to 59)
ss : the seconds with a leading 0 (00 to 59)
ap : use a 12-hour clock instead of a 24-hour clock, with 'ap' replaced by the localized string for am or pm.
AP : use a 12-hour clock instead of a 24-hour clock, with 'AP' replaced by the localized string for AM or PM.
iso : the date with time and timezone. Must be the only format present.

You might get unexpected results if the date you are formatting contains localized month names, which can happen if you changed the format tweaks to contain MMMM. In this case, instead of using something like {pubdate:format_date(yyyy)}, write the template using template program mode as in {:'format_date(raw_field('pubdate'),'yyyy')'}.  

- **finish_formatting(val, fmt, prefix, suffix)** – apply the format, prefix, and suffix to a value in the same way as done in a template like {series_index:05.2f| - | - }. This function is provided to ease conversion of complex single-function- or template-program-mode templates to *general program mode* (page 189) (see below) to take advantage of GPM template compilation. For example, the following program produces the same output as the above template:

```plaintext
program: finish_formatting(field("series_index"), "05.2f", " - ", " - ")
```

Another example: for the template

```plaintext
{series:re({[^\s]}[^\s]+(\s|$), \1}){series_index:0>2s| - | - }{title}
```

use:

```plaintext
program:
    strcat(
        re(field('series'), '{[^\s]}[^\s]+(\s|$)', '\1'),
        finish_formatting(field('series_index'), '0>2s', ' - ', ' - '),
        field('title')
    )
```

- **formats_modtimes(format_string)** – return a comma-separated list of colon-separated items representing modification times for the formats of a book. The format_string parameter specifies how the date is to be formatted. See the `format_date()` function for details. You can use the select function to get the mod time for a specific format. Note that format names are always uppercase, as in EPUB.

- **formats_paths()** – return a comma-separated list of colon-separated items representing full path to the formats of a book. You can use the select function to get the path for a specific format. Note that format names are always uppercase, as in EPUB.

- **formats_sizes()** – return a comma-separated list of colon-separated items representing sizes in bytes of the formats of a book. You can use the select function to get the size for a specific format. Note that format names are always uppercase, as in EPUB.

- **has_cover()** – return Yes if the book has a cover, otherwise return the empty string
• **not(value)** – returns the string “1” if the value is empty, otherwise returns the empty string. This function works well with `test` or `first_non_empty`.

• **list_difference(list1, list2, separator)** – return a list made by removing from `list1` any item found in `list2`, using a case-insensitive comparison. The items in `list1` and `list2` are separated by separator, as are the items in the returned list.

• **list_equals(list1, sep1, list2, sep2, yes_val, no_val)** – return `yes_val` if `list1` and `list2` contain the same items, otherwise return `no_val`. The items are determined by splitting each list using the appropriate separator character (`sep1` or `sep2`). The order of items in the lists is not relevant. The comparison is case-insensitive.

• **list_intersection(list1, list2, separator)** – return a list made by removing from `list1` any item not found in `list2`, using a case-insensitive comparison. The items in `list1` and `list2` are separated by separator, as are the items in the returned list.

• **list_re(src_list, separator, include_re, opt_replace)** – Construct a list by first separating `src_list` into items using the `separator` character. For each item in the list, check if it matches `include_re`. If it does, then add it to the list to be returned. If `opt_replace` is not the empty string, then apply the replacement before adding the item to the returned list.

• **list_re_group(src_list, separator, include_re, search_re, template_for_group_1, for_group_2, ...)** – Like list_re except replacements are not optional. It uses `re_group(item, search_re, template ...)` when doing the replacements.

• **list_sort(list, direction, separator)** – return list sorted using a case-insensitive sort. If `direction` is zero, the list is sorted ascending, otherwise descending. The list items are separated by separator, as are the items in the returned list.

• **list_union(list1, list2, separator)** – return a list made by merging the items in list1 and list2, removing duplicate items using a case-insensitive comparison. If items differ in case, the one in list1 is used. The items in list1 and list2 are separated by separator, as are the items in the returned list.

• **multiply(x, y)** – returns `x * y`. Throws an exception if either `x` or `y` are not numbers.

• **ondevice()** – return the string “Yes” if ondevice is set, otherwise return the empty string.

• **or(value, value, ...)** – returns the string “1” if any value is not empty, otherwise returns the empty string. This function works well with `test` or `first_non_empty`. You can have as many values as you want.

• **print(a, b, ...)** – prints the arguments to standard output. Unless you start calibre from the command line (`calibre-debug -g`), the output will go to a black hole.

• **raw_field(name)** – returns the metadata field named by name without applying any formatting.

• **raw_list(name, separator)** – returns the metadata list named by name without applying any formatting or sorting and with items separated by separator.

• **re_group(val, pattern, template_for_group_1, for_group_2, ...)** – return a string made by applying the regular expression pattern to the `val` and replacing each matched instance with the string computed by replacing each matched group by the value returned by the corresponding template. The original matched value for the group is available as `$`. In template program mode, like for the template and the eval functions, you use `[[` for `{` and `]]` for `}`. The following example in template program mode looks for series with more than one word and uppercases the first word:

```python
{series:'re_group($, "(\S* )(.*)", "[$:uppercase()]", "[$]"')}
```

• **series_sort()** – returns the series sort value.

• **strcat(a, b, ...)** – can take any number of arguments. Returns a string formed by concatenating all the arguments.
- `strcat_max(max, string1, prefix2, string2, ...)` - Returns a string formed by concatenating the arguments. The returned value is initialized to `string1`. Prefix, string pairs are added to the end of the value as long as the resulting string length is less than `max`. `string1` is returned even if `string1` is longer than `max`. You can pass as many `prefix, string` pairs as you wish.

- `strcmp(x, y, lt, eq, gt)` - does a case-insensitive comparison `x` and `y` as strings. Returns `lt` if `x < y`. Returns `eq` if `x == y`. Otherwise returns `gt`.

- `strlen(a)` - Returns the length of the string passed as the argument.

- `substr(str, start, end)` - returns the `start`'th through the `end`'th characters of `str`. The first character in `str` is the zero'th character. If `end` is negative, then it indicates that many characters counting from the right. If `end` is zero, then it indicates the last character. For example, `substr('12345', 1, 0)` returns '2345', and `substr('12345', 1, -1)` returns '234'.

- `subtract(x, y)` - returns `x - y`. Throws an exception if either `x` or `y` are not numbers.

- `today()` - return a date string for today. This value is designed for use in `format_date` or `days_between`, but can be manipulated like any other string. The date is in ISO format.

- `template(x)` - evaluates `x` as a template. The evaluation is done in its own context, meaning that variables are not shared between the caller and the template evaluation. Because the `{` and `}` characters are special, you must use `[[` for the `{` character and `]]` for the `}` character; they are converted automatically. For example, `template('[[title_sort]]')` will evaluate the template ```{title_sort}` and return its value. Note also that prefixes and suffixes (the `|prefix|suffix` syntax) cannot be used in the argument to this function when using template program mode.

### 10.3.6 Function classification

**Reference for all built-in template language functions**

Here, we document all the built-in functions available in the calibre template language. Every function is implemented as a class in python and you can click the source links to see the source code, in case the documentation is insufficient. The functions are arranged in logical groups by type.

- **Arithmetic** (page 174)
  - `add(x, y)` (page 174)
  - `divide(x, y)` (page 174)
  - `multiply(x, y)` (page 174)
  - `subtract(x, y)` (page 174)

- **Boolean** (page 174)
  - `and(value, value, ...)` (page 174)
  - `not(value)` (page 174)
  - `or(value, value, ...)` (page 175)

- **Date functions** (page 175)
  - `days_between(date1, date2)` (page 175)
  - `today()` (page 175)

- **Formatting values** (page 175)
• \texttt{finish\_formatting(val, fmt, prefix, suffix)} (page 175)
• \texttt{format\_date(val, format\_string)} (page 175)
• \texttt{format\_number(v, template)} (page 176)
• \texttt{human\_readable(v)} (page 176)

• \textbf{Get values from metadata} (page 176)
  • \texttt{approximate\_formats()} (page 176)
  • \texttt{author\_links(val\_separator, pair\_separator)} (page 176)
  • \texttt{author\_sorts(val\_separator)} (page 176)
  • \texttt{booksize()} (page 176)
  • \texttt{current\_library\_name()} (page 177)
  • \texttt{current\_library\_path()} (page 177)
  • \texttt{field(name)} (page 177)
  • \texttt{formats\_modtimes(date\_format)} (page 177)
  • \texttt{formats\_paths()} (page 177)
  • \texttt{formats\_sizes()} (page 177)
  • \texttt{has\_cover()} (page 177)
  • \texttt{language\_codes(lang\_strings)} (page 178)
  • \texttt{language\_strings(lang\_codes, localize)} (page 178)
  • \texttt{ondevice()} (page 178)
  • \texttt{raw\_field(name)} (page 178)
  • \texttt{raw\_list(name, separator)} (page 178)
  • \texttt{series\_sort()} (page 178)
  • \texttt{user\_categories()} (page 178)
  • \texttt{virtual\_libraries()} (page 179)

• \textbf{If-then-else} (page 179)
  • \texttt{contains(val, pattern, text if match, text if not match)} (page 179)
  • \texttt{ifempty(val, text if empty)} (page 179)
  • \texttt{test(val, text if not empty, text if empty)} (page 179)

• \textbf{Iterating over values} (page 179)
  • \texttt{first\_non\_empty(value, value, \ldots)} (page 179)
  • \texttt{lookup(val, pattern, field, pattern, field, \ldots, else\_field)} (page 179)
  • \texttt{switch(val, pattern, field, pattern, field, \ldots, else\_value)} (page 179)

• \textbf{List lookup} (page 180)
  • \texttt{identifier\_in\_list(val, id, found\_val, not\_found\_val)} (page 180)
  • \texttt{in\_list(val, separator, pattern, found\_val, \ldots, not\_found\_val)} (page 180)
- `list_item(val, index, separator)` (page 180)
- `select(val, key)` (page 180)
- `str_in_list(val, separator, string, found_val, …, not_found_val)` (page 180)

**List manipulation** (page 181)
- `count(val, separator)` (page 181)
- `list_difference(list1, list2, separator)` (page 181)
- `list_equals(list1, sep1, list2, sep2, yes_val, no_val)` (page 181)
- `list_intersection(list1, list2, separator)` (page 181)
- `list_re(src_list, separator, include_re, opt_replace)` (page 181)
- `list_re_group(src_list, separator, include_re, search_re, group_1_template, …)` (page 181)
- `list_sort(list, direction, separator)` (page 182)
- `list_union(list1, list2, separator)` (page 182)
- `subitems(val, start_index, end_index)` (page 182)
- `sublist(val, start_index, end_index, separator)` (page 182)

**Other** (page 182)
- `assign(id, val)` (page 182)
- `print(a, b, …)` (page 182)

**Recursion** (page 183)
- `eval(template)` (page 183)
- `template(x)` (page 183)

**Relational** (page 183)
- `cmp(x, y, lt, eq, gt)` (page 183)
- `first_matching_cmp(val, cmp1, result1, cmp2, r2, …, else_result)` (page 183)
- `strcmp(x, y, lt, eq, gt)` (page 183)

**String case changes** (page 183)
- `capitalize(val)` (page 184)
- `lowercase(val)` (page 184)
- `titlecase(val)` (page 184)
- `uppercase(val)` (page 184)

**String manipulation** (page 184)
- `re(val, pattern, replacement)` (page 184)
- `re_group(val, pattern, template_for_group_1, for_group_2, …)` (page 184)
- `shorten(val, left chars, middle text, right chars)` (page 184)
- `strcat(a, b, …)` (page 185)
- `strcat_max(max, string1, prefix2, string2, …)` (page 185)
• API of the Metadata objects (page 185)

Arithmetic

add(x, y)

class calibre.utils.formatter_functions.BuiltinAdd
    add(x, y) – returns \(x + y\). Throws an exception if either \(x\) or \(y\) are not numbers.

divide(x, y)

class calibre.utils.formatter_functions.BuiltinDivide
    divide(x, y) – returns \(x / y\). Throws an exception if either \(x\) or \(y\) are not numbers.

multiply(x, y)

class calibre.utils.formatter_functions.BuiltinMultiply
    multiply(x, y) – returns \(x \times y\). Throws an exception if either \(x\) or \(y\) are not numbers.

subtract(x, y)

class calibre.utils.formatter_functions.BuiltinSubtract
    subtract(x, y) – returns \(x - y\). Throws an exception if either \(x\) or \(y\) are not numbers.

Boolean

and(value, value, ...)

class calibre.utils.formatter_functions.BuiltinAnd
    and(value, value, ...) – returns the string “1” if all values are not empty, otherwise returns the empty string. This function works well with test or first_non_empty. You can have as many values as you want.

not(value)

class calibre.utils.formatter_functions.BuiltinNot
    not(value) – returns the string “1” if the value is empty, otherwise returns the empty string. This function works well with test or first_non_empty.
or(value, value, …)

class calibre.utils.formatter_functions.BuiltinOr
or(value, value, …) – returns the string “1” if any value is not empty, otherwise returns the empty string. This function works well with test or first_non_empty. You can have as many values as you want.

Date functions

days_between(date1, date2)

class calibre.utils.formatter_functions.BuiltinDaysBetween
days_between(date1, date2) – return the number of days between date1 and date2. The number is positive if date1 is greater than date2, otherwise negative. If either date1 or date2 are not dates, the function returns the empty string.

today()

class calibre.utils.formatter_functions.BuiltinToday
today() – return a date string for today. This value is designed for use in format_date or days_between, but can be manipulated like any other string. The date is in ISO format.

Formatting values

finish_formatting(val, fmt, prefix, suffix)

class calibre.utils.formatter_functions.BuiltinFinishFormatting
finish_formatting(val, fmt, prefix, suffix) – apply the format, prefix, and suffix to a value in the same way as done in a template like \{series_index:05.2f|-|-\}. For example, the following program produces the same output as the above template: program: finish_formatting(field(“series_index”), “05.2f”, “ - ”, “ - ”)

format_date(val, format_string)

class calibre.utils.formatter_functions.BuiltinFormatDate
format_date(val, format_string) – format the value, which must be a date, using the format_string, returning a string. The formatting codes are: d: the day as number without a leading zero (1 to 31) dd: the day as number with a leading zero (01 to 31) ddd: the abbreviated localized day name (e.g. “Mon” to “Sun”). dddd: the long localized day name (e.g. “Monday” to “Sunday”). M: the month as number without a leading zero (1 to 12). MM: the month as number with a leading zero (01 to 12) MMM: the abbreviated localized month name (e.g. “Jan” to “Dec”). MMMM: the long localized month name (e.g. “January” to “December”). yy: the year as two digit number (00 to 99). yyyy: the year as four digit number. h: the hours without a leading 0 (0 to 11 or 0 to 23, depending on am/pm) hh: the hours with a leading 0 (00 to 11 or 00 to 23, depending on am/pm) m: the minutes without a leading 0 (0 to 59) mm: the minutes with a leading 0 (00 to 59) s: the seconds without a leading 0 (0 to 59) ss: the seconds with a leading 0 (00 to 59) ap: use a 12-hour clock instead of a 24-hour clock, with “ap” replaced by the localized string for am or pm AP: use a 12-hour clock instead of a 24-hour clock, with “AP” replaced by the localized string for AM or PM iso: the date with time and timezone. Must be the only format present.
format_number(v, template)

class calibre.utils.formatter_functions.BuiltinFormatNumber
    format_number(v, template) – format the number v using a Python formatting template such as “{0:5.2f}” or “{0:.d}” or “${0:5,.2f}”. The field_name part of the template must be a 0 (zero) (the “{0:” in the above examples). See the template language and Python documentation for more examples. You can leave off the leading “{(0:” and trailing “})” if the template contains only a format. Returns the empty string if formatting fails.

human_readable(v)

class calibre.utils.formatter_functions.BuiltinHumanReadable
    human_readable(v) – return a string representing the number v in KB, MB, GB, etc.

Get values from metadata

approximate_formats()

class calibre.utils.formatter_functions.BuiltinApproximateFormats
    approximate_formats() – return a comma-separated list of formats that at one point were associated with the book. There is no guarantee that this list is correct, although it probably is. This function can be called in template program mode using the template “{:'approximate_formats()’}”. Note that format names are always uppercase, as in EPUB. This function works only in the GUI. If you want to use these values in save-to-disk or send-to-device templates then you must make a custom “Column built from other columns”, use the function in that column’s template, and use that column’s value in your save/send templates.

author_links(val_separator, pair_separator)

class calibre.utils.formatter_functions.BuiltinAuthorLinks
    author_links(val_separator, pair_separator) – returns a string containing a list of authors and that author’s link values in the form author1 val_separator author1link pair_separator author2 val_separator author2link etc. An author is separated from its link value by the val_separator string with no added spaces. author:linkvalue pairs are separated by the pair_separator string argument with no added spaces. It is up to you to choose separator strings that do not occur in author names or links. An author is included even if the author link is empty.

author_sorts(val_separator)

class calibre.utils.formatter_functions.BuiltinAuthorSorts
    author_sorts(val_separator) – returns a string containing a list of author’s sort values for the authors of the book. The sort is the one in the author metadata (different from the author_sort in books). The returned list has the form author sort 1 val_separator author sort 2 etc. The author sort values in this list are in the same order as the authors of the book. If you want spaces around val_separator then include them in the separator string.

booksize()

class calibre.utils.formatter_functions.BuiltinBooksize
    booksize() – return value of the size field. This function works only in the GUI. If you want to use this value in save-to-disk or send-to-device templates then you must make a custom “Column built from other columns”, use the function in that column’s template, and use that column’s value in your save/send templates.
current_library_name()

class calibre.utils.formatter_functions.BuiltinCurrentLibraryName
    current_library_name() – return the last name on the path to the current calibre library. This function can be called in template program mode using the template “{"current_library_name()}”.

current_library_path()

class calibre.utils.formatter_functions.BuiltinCurrentLibraryPath
    current_library_path() – return the path to the current calibre library. This function can be called in template program mode using the template “{"current_library_path()}”.

field(name)

class calibre.utils.formatter_functions.BuiltinField
    field(name) – returns the metadata field named by name

formats_modtimes(date_format)

class calibre.utils.formatter_functions.BuiltinFormatsModtimes
    formats_modtimes(date_format) – return a comma-separated list of colon-separated items representing modification times for the formats of a book. The date_format parameter specifies how the date is to be formatted. See the format_date function for details. You can use the select function to get the mod time for a specific format. Note that format names are always uppercase, as in EPUB.

formats_paths()

class calibre.utils.formatter_functions.BuiltinFormatsPaths
    formats_paths() – return a comma-separated list of colon-separated items representing full path to the formats of a book. You can use the select function to get the path for a specific format. Note that format names are always uppercase, as in EPUB.

formats_sizes()

class calibre.utils.formatter_functions.BuiltinFormatsSizes
    formats_sizes() – return a comma-separated list of colon-separated items representing sizes in bytes of the formats of a book. You can use the select function to get the size for a specific format. Note that format names are always uppercase, as in EPUB.

has_cover()

class calibre.utils.formatter_functions.BuiltinHasCover
    has_cover() – return Yes if the book has a cover, otherwise return the empty string
language_codes(lang_strings)

class calibre.utils.formatter_functions.BuiltinLanguageCodes
language_codes(lang_strings) – return the language codes for the strings passed in lang_strings. The strings must be in the language of the current locale. Lang_strings is a comma-separated list.

language_strings(lang_codes, localize)

class calibre.utils.formatter_functions.BuiltinLanguageStrings
language_strings(lang_codes, localize) – return the strings for the language codes passed in lang_codes. If localize is zero, return the strings in English. If localize is not zero, return the strings in the language of the current locale. Lang_codes is a comma-separated list.

ondevice()

class calibre.utils.formatter_functions.BuiltinOndevice
ondevice() – return Yes if ondevice is set, otherwise return the empty string. This function works only in the GUI. If you want to use this value in save-to-disk or send-to-device templates then you must make a custom “Column built from other columns”, use the function in that column’s template, and use that column’s value in your save/send templates

raw_field(name)

class calibre.utils.formatter_functions.BuiltinRawField
raw_field(name) – returns the metadata field named by name without applying any formatting.

raw_list(name, separator)

class calibre.utils.formatter_functions.BuiltinRawList
raw_list(name, separator) – returns the metadata list named by name without applying any formatting or sorting and with items separated by separator.

series_sort()

class calibre.utils.formatter_functions.BuiltinSeriesSort
series_sort() – return the series sort value

user_categories()

class calibre.utils.formatter_functions.BuiltinUserCategories
user_categories() – return a comma-separated list of the user categories that contain this book. This function works only in the GUI. If you want to use these values in save-to-disk or send-to-device templates then you must make a custom “Column built from other columns”, use the function in that column’s template, and use that column’s value in your save/send templates
virtual_libraries()

class calibre.utils.formatter_functions.BuiltinVirtualLibraries
virtual_libraries() – return a comma-separated list of virtual libraries that contain this book. This function works
only in the GUI. If you want to use these values in save-to-disk or send-to-device templates then you must make
a custom “Column built from other columns”, use the function in that column’s template, and use that column’s
value in your save/send templates

If-then-else

contains(val, pattern, text if match, text if not match)

class calibre.utils.formatter_functions.BuiltinContains
contains(val, pattern, text if match, text if not match) – checks if val contains matches for the regular expression
pattern. Returns text if match if matches are found, otherwise it returns text if no match

ifempty(val, text if empty)

class calibre.utils.formatter_functions.BuiltinIfempty
ifempty(val, text if empty) – return val if val is not empty, otherwise return text if empty

test(val, text if not empty, text if empty)

class calibre.utils.formatter_functions.BuiltinTest
test(val, text if not empty, text if empty) – return text if not empty if val is not empty, otherwise return text if
empty

Iterating over values

first_non_empty(value, value, . . .)

class calibre.utils.formatter_functions.BuiltinFirstNonEmpty
first_non_empty(value, value, . . .) – returns the first value that is not empty. If all values are empty, then the
empty value is returned. You can have as many values as you want.

lookup(val, pattern, field, pattern, field, . . ., else_field)

class calibre.utils.formatter_functions.BuiltinLookup
lookup(val, pattern, field, pattern, field, . . ., else_field) – like switch, except the arguments are field (metadata)
names, not text. The value of the appropriate field will be fetched and used. Note that because composite
columns are fields, you can use this function in one composite field to use the value of some other composite
field. This is extremely useful when constructing variable save paths

switch(val, pattern, value, pattern, value, . . ., else_value)

class calibre.utils.formatter_functions.BuiltinSwitch
switch(val, pattern, value, pattern, value, . . ., else_value) – for each pattern, value pair, checks if val matches
the regular expression **pattern** and if so, returns that **value**. If no pattern matches, then **else_value** is returned. You can have as many **pattern, value** pairs as you want.

**List lookup**

**identifier_in_list**(<span class="code-highlight">val</span>, <span class="code-highlight">id</span>, <span class="code-highlight">found_val</span>, <span class="code-highlight">not_found_val</span>)

**class** `calibre.utils.formatter_functions.BuiltinIdentifierInList`

`identifier_in_list(val, id, found_val, not_found_val)` – treat val as a list of identifiers separated by commas, comparing the string against each value in the list. An identifier has the format “identifier:value”. The id parameter should be either “id” or “id:regexp”. The first case matches if there is any identifier with that id. The second case matches if the regexp matches the identifier’s value. If there is a match, return found_val, otherwise return not_found_val.

**in_list**(<span class="code-highlight">val</span>, <span class="code-highlight">separator</span>, <span class="code-highlight">pattern</span>, **found_val**, ..., **not_found_val**)

**class** `calibre.utils.formatter_functions.BuiltinInList`

`in_list(val, separator, pattern, found_val, . . . , not_found_val)` – treat val as a list of items separated by separator, evaluating the pattern against each value in the list. If the pattern matches a value, return found_val, otherwise return not_found_val. The pattern and found_value can be repeated as many times as desired, permitting returning different values depending on the search. The patterns are checked in order. The first match is returned.

**list_item**(<span class="code-highlight">val</span>, <span class="code-highlight">index</span>, <span class="code-highlight">separator</span>)

**class** `calibre.utils.formatter_functions.BuiltinListitem`

`list_item(val, index, separator)` – interpret the value as a list of items separated by `separator`, returning the `index`th item. The first item is number zero. The last item can be returned using `list_item(-1, separator)`. If the item is not in the list, then the empty value is returned. The separator has the same meaning as in the count function.

**select**(<span class="code-highlight">val</span>, <span class="code-highlight">key</span>)

**class** `calibre.utils.formatter_functions.BuiltinSelect`

`select(val, key)` – interpret the value as a comma-separated list of items, with the items being “id:value”. Find the pair with the id equal to key, and return the corresponding value.

**str_in_list**(<span class="code-highlight">val</span>, <span class="code-highlight">separator</span>, <span class="code-highlight">string</span>, **found_val**, ..., **not_found_val**)

**class** `calibre.utils.formatter_functions.BuiltinStrInList`

`str_in_list(val, separator, string, found_val, . . . , not_found_val)` – treat val as a list of items separated by separator, comparing the string against each value in the list. If the string matches a value (ignoring case) then return found_val, otherwise return not_found_val. If the string contains separators, then it is also treated as a list and each value is checked. The string and found_value can be repeated as many times as desired, permitting returning different values depending on the search. The strings are checked in order. The first match is returned.
List manipulation

*count(val, separator)*

```python
class calibre.utils.formatter_functions.BuiltinCount
count(val, separator) -- interprets the value as a list of items separated by separator, returning the number of items in the list. Most lists use a comma as the separator, but authors uses an ampersand. Examples: {tags:count(,)}, {authors:count(&)}
```

*list_difference(list1, list2, separator)*

```python
class calibre.utils.formatter_functions.BuiltinListDifference
list_difference(list1, list2, separator) -- return a list made by removing from list1 any item found in list2, using a case-insensitive comparison. The items in list1 and list2 are separated by separator, as are the items in the returned list.
```

*list_equals(list1, sep1, list2, sep2, yes_val, no_val)*

```python
class calibre.utils.formatter_functions.BuiltinListEquals
list_equals(list1, sep1, list2, sep2, yes_val, no_val) -- return yes_val if list1 and list2 contain the same items, otherwise return no_val. The items are determined by splitting each list using the appropriate separator character (sep1 or sep2). The order of items in the lists is not relevant. The comparison is case insensitive.
```

*list_intersection(list1, list2, separator)*

```python
class calibre.utils.formatter_functions.BuiltinListIntersection
list_intersection(list1, list2, separator) -- return a list made by removing from list1 any item not found in list2, using a case-insensitive comparison. The items in list1 and list2 are separated by separator, as are the items in the returned list.
```

*list_re(src_list, separator, include_re, opt_replace)*

```python
class calibre.utils.formatter_functions.BuiltinListRe
list_re(src_list, separator, include_re, opt_replace) -- Construct a list by first separating src_list into items using the separator character. For each item in the list, check if it matches include_re. If it does, then add it to the list to be returned. If opt_replace is not the empty string, then apply the replacement before adding the item to the returned list.
```

*list_re_group(src_list, separator, include_re, search_re, group_1_template, ...)*

```python
class calibre.utils.formatter_functions.BuiltinListReGroup
list_re_group(src_list, separator, include_re, search_re, group_1_template, ...) -- Like list_re except replacements are not optional. It uses re_group(list_item, search_re, group_1_template, ...) when doing the replacements on the resulting list.
```
list_sort(list, direction, separator)

class calibre.utils.formatter_functions.BuiltinListSort

list_sort(list, direction, separator) – return list sorted using a case-insensitive sort. If direction is zero, the list is sorted ascending, otherwise descending. The list items are separated by separator, as are the items in the returned list.

list_union(list1, list2, separator)

class calibre.utils.formatter_functions.BuiltinListUnion

list_union(list1, list2, separator) – return a list made by merging the items in list1 and list2, removing duplicate items using a case-insensitive comparison. If items differ in case, the one in list1 is used. The items in list1 and list2 are separated by separator, as are the items in the returned list.

subitems(val, start_index, end_index)

class calibre.utils.formatter_functions.BuiltinSubitems

subitems(val, start_index, end_index) – This function is used to break apart lists of items such as genres. It interprets the value as a comma-separated list of items, where each item is a period-separated list. Returns a new list made by first finding all the period-separated items, then for each such item extracting the start_index to the end_index components, then combining the results back together. The first component in a period-separated list has an index of zero. If an index is negative, then it counts from the end of the list. As a special case, an end_index of zero is assumed to be the length of the list. Example using basic template mode and assuming a #genre value of “A.B.C”: {#genre:subitems(0,1)} returns “A”. {#genre:subitems(0,2)} returns “A.B”. {#genre:subitems(1,0)} returns “B.C”. Assuming a #genre value of “A.B.C, D.E.F”, {#genre:subitems(0,1)} returns “A, D”. {#genre:subitems(0,2)} returns “A.B, D.E”

sublist(val, start_index, end_index, separator)

class calibre.utils.formatter_functions.BuiltinSublist

sublist(val, start_index, end_index, separator) – interpret the value as a list of items separated by separator, returning a new list made from the start_index to the end_index item. The first item is number zero. If an index is negative, then it counts from the end of the list. As a special case, an end_index of zero is assumed to be the length of the list. Examples using basic template mode and assuming that the tags column (which is comma-separated) contains “A, B, C”: {tags:sublist(0,1,\,)} returns “A”. {tags:sublist(-1,0,\,)} returns “C”. {tags:sublist(0,-1,\,)} returns “A, B”.

Other

assign(id, val)

class calibre.utils.formatter_functions.BuiltinAssign

assign(id, val) – assigns val to id, then returns val. id must be an identifier, not an expression

print(a, b, ...)

class calibre.utils.formatter_functions.BuiltinPrint

print(a, b, ...) – prints the arguments to standard output. Unless you start calibre from the command line (calibre-debug -g), the output will go to a black hole.
Recursion

eval(template)

class calibre.utils.formatter_functions.BuiltinEval
eval(template) – evaluates the template, passing the local variables (those ‘assign’ed to) instead of the book metadata. This permits using the template processor to construct complex results from local variables. Because the { and } characters are special, you must use [[ for the { character and ]] for the } character; they are converted automatically. Note also that prefixes and suffixes (the |prefix|suffix syntax) cannot be used in the argument to this function when using template program mode.

template(x)

class calibre.utils.formatter_functions.BuiltinTemplate
template(x) – evaluates x as a template. The evaluation is done in its own context, meaning that variables are not shared between the caller and the template evaluation. Because the { and } characters are special, you must use [[ for the { character and ]] for the } character; they are converted automatically. For example, template('[[title_sort]]') will evaluate the template {title_sort} and return its value. Note also that prefixes and suffixes (the |prefix|suffix syntax) cannot be used in the argument to this function when using template program mode.

Relational

cmp(x, y, lt, eq, gt)

class calibre.utils.formatter_functions.BuiltinCmp
cmp(x, y, lt, eq, gt) – compares x and y after converting both to numbers. Returns lt if x < y. Returns eq if x == y. Otherwise returns gt.

first_matching_cmp(val, cmp1, result1, cmp2, r2, ..., else_result)

class calibre.utils.formatter_functions.BuiltinFirstMatchingCmp
first_matching_cmp(val, cmp1, result1, cmp2, r2, ..., else_result) – compares “val < cmpN” in sequence, returning resultN for the first comparison that succeeds. Returns else_result if no comparison succeeds. Example: first_matching_cmp(10,"small",10,"middle",15,"large","giant") returns “large”. The same example with a first value of 16 returns “giant”.

strcmp(x, y, lt, eq, gt)

class calibre.utils.formatter_functions.BuiltinStrcmp
strcmp(x, y, lt, eq, gt) – does a case-insensitive comparison of x and y as strings. Returns lt if x < y. Returns eq if x == y. Otherwise returns gt.

String case changes
capitalize(val)

class calibre.utils.formatter_functions.BuiltinCapitalization
capitalize(val) – return val capitalized

lowercase(val)

class calibre.utils.formatter_functions.BuiltinLowercase
lowercase(val) – return val in lower case

titlecase(val)

class calibre.utils.formatter_functions.BuiltinTitlecase
titlecase(val) – return val in title case

uppercase(val)

class calibre.utils.formatter_functions.BuiltinUppercase
uppercase(val) – return val in upper case

String manipulation

re(val, pattern, replacement)

class calibre.utils.formatter_functions.BuiltinRe
re(val, pattern, replacement) – return val after applying the regular expression. All instances of pattern are
replaced with replacement. As in all of calibre, these are Python-compatible regular expressions

re_group(val, pattern, template_for_group_1, for_group_2, …)

class calibre.utils.formatter_functions.BuiltinReGroup
re_group(val, pattern, template_for_group_1, for_group_2, …) – return a string made by applying the regular
expression pattern to the val and replacing each matched instance with the string computed by replacing each
matched group by the value returned by the corresponding template. The original matched value for the group is
available as $. In template program mode, like for the template and the eval functions, you use [{ for { and }] for }
The following example in template program mode looks for series with more than one word and uppercases
the first word: {series:re_group($, "([S* ]\([*]+\))", "$[uppercase()]", "$[]")}

shorten(val, left chars, middle text, right chars)

class calibre.utils.formatter_functions.BuiltinShorten
shorten(val, left chars, middle text, right chars) – Return a shortened version of val, consisting of left chars
characters from the beginning of val, followed by middle text, followed by right chars characters from the end
of the string. Left chars and right chars must be integers. For example, assume the title of the book is Ancient
English Laws in the Times of Ivanhoe, and you want it to fit in a space of at most 15 characters. If you use
{title:shorten(9,..5)}, the result will be Ancient E-nhoe. If the field’s length is less than left chars + right chars
+ the length of middle text, then the field will be used intact. For example, the title The Dome would not be
changed.

184 Chapter 10. Tutorials
strcat(a, b, ...)

```python
class calibre.utils.formatter_functions.BuiltinStrcat
strcat(a, b, ...) – can take any number of arguments. Returns a string formed by concatenating all the arguments
```

strcat_max(max, string1, prefix2, string2, ...)

```python
class calibre.utils.formatter_functions.BuiltinStrcatMax
strcat_max(max, string1, prefix2, string2, ...) – Returns a string formed by concatenating the arguments. The returned value is initialized to string1. Prefix, string pairs are added to the end of the value as long as the resulting string length is less than max. String1 is returned even if string1 is longer than max. You can pass as many prefix, string pairs as you wish.
```

strlen(a)

```python
class calibre.utils.formatter_functions.Builtin_strlen
strlen(a) – Returns the length of the string passed as the argument
```

substr(str, start, end)

```python
class calibre.utils.formatter_functions.BuiltinSubstr
substr(str, start, end) – returns the start’th through the end’th characters of str. The first character in str is the zero’th character. If end is negative, then it indicates that many characters counting from the right. If end is zero, then it indicates the last character. For example, substr('12345', 1, 0) returns ‘2345’, and substr(‘12345’, 1, -1) returns ‘234’.
```

swap_around_comma(val)

```python
class calibre.utils.formatter_functions.BuiltinSwapAroundComma
swap_around_comma(val) – given a value of the form “B, A”, return “A B”. This is most useful for converting names in LN, FN format to FN LN. If there is no comma, the function returns val unchanged
```

transliterate(a)

```python
class calibre.utils.formatter_functions.BuiltinTransliterate
transliterate(a) – Returns a string in a latin alphabet formed by approximating the sound of the words in the source string. For example, if the source is “Фёдор Михаилович Достоевский” the function returns “Fiodor Mikhailovich Dostoievskii”.
```

API of the Metadata objects

The python implementation of the template functions is passed in a Metadata object. Knowing it’s API is useful if you want to define your own template functions.

```python
class calibre.ebooks.metadata.book.base.Metadata(title, authors=(u'Unknown',),
other=None, template_cache=None,
formatter=None)
```

A class representing all the metadata for a book. The various standard metadata fields are available as attributes of this object. You can also stick arbitrary attributes onto this object.
Metadata from custom columns should be accessed via the get() method, passing in the lookup name for the column, for example: “#mytags”.

Use the is_null() (page 186) method to test if a field is null.

This object also has functions to format fields into strings.

The list of standard metadata fields grows with time is in STANDARD_METADATA_FIELDS (page 187).

Please keep the method based API of this class to a minimum. Every method becomes a reserved field name.

is_null(field)
Return True if the value of field is null in this object. ‘null’ means it is unknown or evaluates to False. So a title of _("Unknown") is null or a language of ‘und’ is null.

Be careful with numeric fields since this will return True for zero as well as None.

Also returns True if the field does not exist.

deepcopy(class_generator=<function <lambda>>)
Do not use this method unless you know what you are doing, if you want to create a simple clone of this object, use deepcopy_metadata() instead. Class_generator must be a function that returns an instance of Metadata or a subclass of it.

get_identifiers()
Return a copy of the identifiers dictionary. The dict is small, and the penalty for using a reference where a copy is needed is large. Also, we don’t want any manipulations of the returned dict to show up in the book.

set_identifiers(identifiers)
Set all identifiers. Note that if you previously set ISBN, calling this method will delete it.

set_identifier(typ, val)
If val is empty, deletes identifier of type typ

standard_field_keys()
return a list of all possible keys, even if this book doesn’t have them

custom_field_keys()
return a list of the custom fields in this book

all_field_keys()
All field keys known by this instance, even if their value is None

metadata_for_field(key)
return metadata describing a standard or custom field.

all_non_none_fields()
Return a dictionary containing all non-None metadata fields, including the custom ones.

get_standard_metadata(field, make_copy)
return field metadata from the field if it is there. Otherwise return None. field is the key name, not the label. Return a copy if requested, just in case the user wants to change values in the dict.

get_all_standard_metadata(make_copy)
return a dict containing all the standard field metadata associated with the book.

get_all_user_metadata(make_copy)
return a dict containing all the custom field metadata associated with the book.

get_user_metadata(field, make_copy)
return field metadata from the object if it is there. Otherwise return None. field is the key name, not the label. Return a copy if requested, just in case the user wants to change values in the dict.
**set_all_user_metadata**(metadata)
store custom field metadata into the object. Field is the key name not the label

**set_user_metadata**(field, metadata)
store custom field metadata for one column into the object. Field is the key name not the label

**template_to_attribute**(other, ops)
Takes a list `[(src,dest), (src,dest)]`, evaluates the template in the context of other, then copies the result to self[dest]. This is on a best-efforts basis. Some assignments can make no sense.

**smart_update**(other, replace_metadata=False)
Merge the information in `other` into self. In case of conflicts, the information in `other` takes precedence, unless the information in `other` is NULL.

**format_field**(key, series_with_index=True)
Returns the tuple (display_name, formatted_value)

**to_html**()
A HTML representation of this object.

calibre.ebooks.metadata.book.base.STANDARD_METADATA_FIELDS
The set of standard metadata fields.

```python

'SOCIAL_METADATA_FIELDS = frozenset([
    'tags',  # Ordered list
    'rating',  # A floating point number between 0 and 10
    'comments',  # A simple HTML enabled string
    'series',  # A simple string
    'series_index',  # A floating point number
    # Of the form { scheme1:value1, scheme2:value2}
    # For example: {'isbn':'123456789', 'doi':'xxxx', ... }
    'identifiers',
])

'TOP_LEVEL_IDENTIFIERS = frozenset([
    'isbn',
])

PUBLICATION_METADATA_FIELDS = frozenset([
    'title',  # title must never be None. Should be _('Unknown')
    # Pseudo field that can be set, but if not set is auto generated
    # from title and languages
    'title_sort',
    'authors',  # Ordered list. Must never be None, can be [(_('Unknown'))
    'author_sort_map',  # Map of sort strings for each author
    # Pseudo field that can be set, but if not set is auto generated
    # from authors and languages
    'author_sort',
    'book_producer',
])

(continues on next page)
```
'timestamp',       # Dates and times must be timezone aware
'pubdate',
'last_modified',
'rights',
# So far only known publication type is periodical:calibre
# If None, means book
'publication_type',
'_uuid',          # A UUID usually of type 4
'languages',      # ordered list of languages in this publication
'publisher',      # Simple string, no special semantics
# Absolute path to image file encoded in filesystem_encoding
'cover',          # Of the form (format, data) where format is, for e.g. 'jpeg', 'png', 'gif'...
'cover_data',
# Either thumbnail data, or an object with the attribute
# image_path which is the path to an image file, encoded
# in filesystem_encoding
'thumbnail',
])

BOOK_STRUCTURE_FIELDS = frozenset(
    # These are used by code, Null values are None.
    'toc', 'spine', 'guide', 'manifest',
)

USER_METADATA_FIELDS = frozenset(
    # A dict of dicts similar to field_metadata. Each field description dict
    # also contains a value field with the key #value#.
    'user_metadata',
)

DEVICE_METADATA_FIELDS = frozenset(
    # Ordered list of strings
    'device_collections',
    # Unicode, / separated
    'lpath',
    # In bytes
    'size',
    # Mimetype of the book file being represented
    'mime',
)

CALIBRE_METADATA_FIELDS = frozenset(
    # An application id, currently set to the db_id.
    'application_id',
    # the calibre primary key of the item.
    'db_id',
    # list of formats (extensions) for this book
    'formats',
    # a dict of user category names, where the value is a list of item names
    # from the book that are in that category
    'user_categories',
    # a dict of author to an associated hyperlink
    'author_link_map',
)

ALL_METADATA_FIELDS = SOCIAL_METADATA_FIELDS.union(
    PUBLICATION_METADATA_FIELDS).union(
    BOOK_STRUCTURE_FIELDS).union(
    USER_METADATA_FIELDS).union(
    DEVICE_METADATA_FIELDS).union("(continues on previous page)"
# All fields except custom fields

```python
STANDARD_METADATA_FIELDS = SOCIAL_METADATA_FIELDS.union(PUBLICATION_METADATA_FIELDS).union(BOOK_STRUCTURE_FIELDS).union(DEVICE_METADATA_FIELDS).union(CALIBRE_METADATA_FIELDS)
```

# Metadata fields that smart update must do special processing to copy.

```python
SC_FIELDS_NOT_COPIED = frozenset(['title', 'title_sort', 'authors', 'author_sort', 'author_sort_map', 'cover_data', 'tags', 'languages', 'identifiers'])
```

# Metadata fields that smart update should copy only if the source is not None

```python
SC_FIELDS_COPY_NOT_NULL = frozenset(['device_collections', 'lpath', 'size', 'comments', 'thumbnail'])
```

# Metadata fields that smart update should copy without special handling

```python
SC_COPYABLE_FIELDS = SOCIAL_METADATA_FIELDS.union(PUBLICATION_METADATA_FIELDS).union(BOOK_STRUCTURE_FIELDS).union(DEVICE_METADATA_FIELDS).union(CALIBRE_METADATA_FIELDS) - SC_FIELDS_NOT_COPIED.union(SC_FIELDS_COPY_NOT_NULL)
```

```python
SERIALIZABLE_FIELDS = SOCIAL_METADATA_FIELDS.union(USER_METADATA_FIELDS).union(PUBLICATION_METADATA_FIELDS).union(CALIBRE_METADATA_FIELDS).union(DEVICE_METADATA_FIELDS) - 
frozenset(['device_collections', 'formats', 'cover_data'])
```

# these are rebuilt when needed

## 10.3.7 Using general program mode

For more complicated template programs, it is sometimes easier to avoid template syntax (all the { and } characters), instead writing a more classical-looking program. You can do this in calibre by beginning the template with `program:`. In this case, no template processing is done. The special variable $ is not set. It is up to your program to produce the correct results.

One advantage of `program:` mode is that the brackets are no longer special. For example, it is not necessary to use `[[` and `]]` when using the `template()` function. Another advantage is that program mode templates are compiled to Python and can run much faster than templates in the other two modes. Speed improvement depends on the complexity of the templates; the more complicated the template the more the improvement. Compilation is turned off or on using the tweak `compile_gpm_templates` (Compile General Program Mode templates to Python). The main reason to turn off compilation is if a compiled template does not work, in which case please file a bug report.

The following example is a `program:` mode implementation of a recipe on the MobileRead forum: “Put series into the title, using either initials or a shortened form. Strip leading articles from the series name (any).” For example, for the book The Two Towers in the Lord of the Rings series, the recipe gives *LotR [02] The Two Towers*. Using standard templates, the recipe requires three custom columns and a plugboard, as explained in the following:

### 10.3. The calibre template language
The solution requires creating three composite columns. The first column is used to remove the leading articles. The second is used to compute the ‘shorten’ form. The third is to compute the ‘initials’ form. Once you have these columns, the plugboard selects between them. You can hide any or all of the three columns on the library view:

First column:
Name: #stripped_series.
Template: {series:re('^\(A|The|An\)\s+\)', '')}

Second column (the shortened form):
Name: #shortened.
Template: {#stripped_series:shorten(4, '-', 4)}

Third column (the initials form):
Name: #initials.
Template: {#stripped_series:re('([^\w\d]+([^\w\d]+)' \})

Plugboard expression:
Template: {#stripped_series:lookup(.s, #initials, .., #shortened, series){series_index:0> -2.0f}[(\s+)](title)
Destination field: title

This set of fields and plugboard produces:
Series: The Lord of the Rings
Series index: 2
Title: The Two Towers
Output: LotR [02] The Two Towers

Series: Dahak
Series index: 1
Title: Mutineers Moon
Output: Dahak [01] Mutineers Moon

Series: Berserkers
Series Index: 4
Title: Berserker Throne
Output: Bers-kers [04] Berserker Throne

Series: Meg Langslow Mysteries
Series Index: 3
Title: Revenge of the Wrought-Iron Flamingos
Output: MLM [03] Revenge of the Wrought-Iron Flamingos

The following program produces the same results as the original recipe, using only one custom column to hold the results of a program that computes the special title value:

```
Custom column:
Name: #special_title
Template: (the following with all leading spaces removed)
program:
  # compute the equivalent of the composite fields and store them in local variables
  stripped = re(field('series'), '^\(A|The|An\)\s+', '');
  shortened = shorten(stripped, 4, '-', 4);
  initials = re(stripped, '([^\w\d]+([^\w\d]+)' \})
  # Format the series index. Ends up as empty if there is no series index.
  # Note that leading and trailing spaces will be removed by the formatter, so we cannot add them here. We will do that in the strcat below.
```
# Also note that because we are in 'program' mode, we can freely use
# curly brackets in strings, something we cannot do in template mode.
s_index = template('{'series_index:0>2.0f'}');

# print(stripped, shortened, initials, s_index);

# Now concatenate all the bits together. The switch picks between
# initials and shortened, depending on whether there is a space
# in stripped. We then add the brackets around s_index if it is
# not empty. Finally, add the title. As this is the last function in
# the program, its value will be returned.
strcat(
    switch( stripped,
    '.\s', initials,
    '.', shortened,
    field('series')),
    test(s_index, strcat(' [', s_index, '] '), ''),
    field('title'));

Plugboard expression:
Template:{#special_title}
Destination field: title

It would be possible to do the above with no custom columns by putting the program into the template box of the plugboard. However, to do so, all comments must be removed because the plugboard text box does not support multi-line editing. It is debatable whether the gain of not having the custom column is worth the vast increase in difficulty caused by the program being one giant line.

### 10.3.8 User-defined template functions

You can add your own functions to the template processor. Such functions are written in Python, and can be used in any of the three template programming modes. The functions are added by going to Preferences -> Advanced -> Template functions. Instructions are shown in that dialog.

### 10.3.9 Special notes for save/send templates

Special processing is applied when a template is used in a save to disk or send to device template. The values of the fields are cleaned, replacing characters that are special to file systems with underscores, including slashes. This means that field text cannot be used to create folders. However, slashes are not changed in prefix or suffix strings, so slashes in these strings will cause folders to be created. Because of this, you can create variable-depth folder structure.

For example, assume we want the folder structure `series/series_index - title`, with the caveat that if series does not exist, then the title should be in the top folder. The template to do this is:

```
{series:||/}{series_index:|| - }{title}
```

The slash and the hyphen appear only if series is not empty.

The lookup function lets us do even fancier processing. For example, assume that if a book has a series, then we want the folder structure `series/series index - title.fmt`. If the book does not have a series, then we want the folder structure `genre/author_sort/title.fmt`. If the book has no genre, we want to use ‘Unknown’. We want two completely different paths, depending on the value of series.

To accomplish this, we:
1. Create a composite field (give it lookup name #AA) containing \{series\}/\{series_index\} - \{title\}. If the series is not empty, then this template will produce \textit{series/series_index - title}.

2. Create a composite field (give it lookup name #BB) containing \{#genre:ifempty(Unknown)\}/\{author_sort\}/\{title\}. This template produces \textit{genre/author_sort/title}, where an empty genre is replaced with \textit{Unknown}.

3. Set the save template to \{series:lookup(.,#AA,#BB)\}. This template chooses composite field #AA if series is not empty, and composite field #BB if series is empty. We therefore have two completely different save paths, depending on whether or not \textit{series} is empty.

### 10.3.10 Templates and plugboards

Plugboards are used for changing the metadata written into books during send-to-device and save-to-disk operations. A plugboard permits you to specify a template to provide the data to write into the book’s metadata. You can use plugboards to modify the following fields: authors, author_sort, language, publisher, tags, title, title_sort. This feature helps people who want to use different metadata in books on devices to solve sorting or display issues.

When you create a plugboard, you specify the format and device for which the plugboard is to be used. A special device is provided, save_to_disk, that is used when saving formats (as opposed to sending them to a device). Once you have chosen the format and device, you choose the metadata fields to change, providing templates to supply the new values. These templates are \textit{connected} to their destination fields, hence the name \textit{plugboards}. You can, of course, use composite columns in these templates.

When a plugboard might apply (Content server, save to disk, or send to device), calibre searches the defined plugboards to choose the correct one for the given format and device. For example, to find the appropriate plugboard for an EPUB book being sent to an ANDROID device, calibre searches the plugboards using the following search order:

- a plugboard with an exact match on format and device, e.g., EPUB and ANDROID
- a plugboard with an exact match on format and the special any device choice, e.g., EPUB and any device
- a plugboard with the special any format choice and an exact match on device, e.g., any format and ANDROID
- a plugboard with any format and any device

The tags and authors fields have special treatment, because both of these fields can hold more than one item. A book can have many tags and many authors. When you specify that one of these two fields is to be changed, the template’s result is examined to see if more than one item is there. For tags, the result is cut apart wherever calibre finds a comma. For example, if the template produces the value \textit{Thriller, Horror}, then the result will be two tags, \textit{Thriller} and \textit{Horror}. There is no way to put a comma in the middle of a tag.

The same thing happens for authors, but using a different character for the cut, a \& (ampersand) instead of a comma. For example, if the template produces the value \textit{Blogs, Joe\&Posts, Susan}, then the book will end up with two authors, Blogs, Joe and Posts, Susan. If the template produces the value \textit{Blogs, Joe;Posts, Susan}, then the book will have one author with a rather strange name.

Plugboards affect the metadata written into the book when it is saved to disk or written to the device. Plugboards do not affect the metadata used by \texttt{save to disk} and \texttt{send to device} to create the file names. Instead, file names are constructed using the templates entered on the appropriate preferences window.

### 10.3.11 Helpful tips

You might find the following tips useful.

- Create a custom composite column to test templates. Once you have the column, you can change its template simply by double-clicking on the column. Hide the column when you are not testing.
• Templates can use other templates by referencing a composite custom column.

• In a plugboard, you can set a field to empty (or whatever is equivalent to empty) by using the special template `{}`. This template will always evaluate to an empty string.

• The technique described above to show numbers even if they have a zero value works with the standard field `series_index`.

10.4 All about using regular expressions in calibre

Regular expressions are features used in many places in calibre to perform sophisticated manipulation of e-book content and metadata. This tutorial is a gentle introduction to getting you started with using regular expressions in calibre.

Contents

- First, a word of warning and a word of courage (page 193)
- Where in calibre can you use regular expressions? (page 194)
- What on earth is a regular expression? (page 194)
- Care to explain? (page 194)
- That doesn’t sound too bad. What’s next? (page 194)
- Hey, neat! This is starting to make sense! (page 195)
- Well, these special characters are very neat and all, but what if I wanted to match a dot or a question mark? (page 195)
- So, what are the most useful sets? (page 195)
- But if I had a few varying strings I wanted to match, things get complicated? (page 196)
- You missed. . . (page 196)
- In the beginning, you said there was a way to make a regular expression case insensitive? (page 196)
- I think I’m beginning to understand these regular expressions now. . . how do I use them in calibre? (page 197)
  - Conversions (page 197)
  - Adding books (page 197)

10.4.1 First, a word of warning and a word of courage

This is, inevitably, going to be somewhat technical- after all, regular expressions are a technical tool for doing technical stuff. I’m going to have to use some jargon and concepts that may seem complicated or convoluted. I’m going to try to explain those concepts as clearly as I can, but really can’t do without using them at all. That being said, don’t be discouraged by any jargon, as I’ve tried to explain everything new. And while regular expressions themselves may seem like an arcane, black magic (or, to be more prosaic, a random string of mumbo-jumbo letters and signs), I promise that they are not all that complicated. Even those who understand regular expressions really well have trouble reading
the more complex ones, but writing them isn’t as difficult—you construct the expression step by step. So, take a step
and follow me into the rabbit hole.

10.4.2 Where in calibre can you use regular expressions?

There are a few places calibre uses regular expressions. There’s the Search & replace in conversion options, metadata
detection from filenames in the import settings and Search & replace when editing the metadata of books in bulk. The
calibre book editor can also use regular expressions in its search and replace feature.

10.4.3 What on earth is a regular expression?

A regular expression is a way to describe sets of strings. A single regular expression can match a number of different
strings. This is what makes regular expression so powerful—they are a concise way of describing a potentially large
number of variations.

Note: I’m using string here in the sense it is used in programming languages: a string of one or more characters,
characters including actual characters, numbers, punctuation and so-called whitespace (linebreaks, tabulators etc.).
Please note that generally, uppercase and lowercase characters are not considered the same, thus “a” being a different
character from “A” and so forth. In calibre, regular expressions are case insensitive in the Search bar, but not in the
conversion options. There’s a way to make every regular expression case insensitive, but we’ll discuss that later. It gets
complicated because regular expressions allow for variations in the strings it matches, so one expression can match
multiple strings, which is why people bother using them at all. More on that in a bit.

10.4.4 Care to explain?

Well, that’s why we’re here. First, this is the most important concept in regular expressions: A string by itself is a
regular expression that matches itself. That is to say, if I wanted to match the string "Hello, World!" using
a regular expression, the regular expression to use would be Hello, World!. And yes, it really is that simple.
You’ll notice, though, that this only matches the exact string "Hello, World!", not e.g. "Hello, wOrld!" or
"hello, world!" or any other such variation.

10.4.5 That doesn’t sound too bad. What’s next?

Next is the beginning of the really good stuff. Remember where I said that regular expressions can match multiple
strings? This is where it gets a little more complicated. Say, as a somewhat more practical exercise, the e-book you
wanted to convert had a nasty footer counting the pages, like “Page 5 of 423”. Obviously the page number would rise
from 1 to 423, thus you’d have to match 423 different strings, right? Wrong, actually: regular expressions allow you
to define sets of characters that are matched: To define a set, you put all the characters you want to be in the set into
square brackets. So, for example, the set [abc] would match either the character “a”, “b” or “c”. Sets will always
only match one of the characters in the set. They “understand” character ranges, that is, if you wanted to match all the
lower case characters, you’d use the set [a-z] for lower- and uppercase characters you’d use [a-zA-Z] and so on.
Got the idea? So, obviously, using the expression Page [0-9] of 423 you’d be able to match the first 9 pages,
thus reducing the expressions needed to three: The second expression Page [0-9][0-9] of 423 would match
all two-digit page numbers, and I’m sure you can guess what the third expression would look like. Yes, go ahead.
Write it down.
10.4.6 Hey, neat! This is starting to make sense!

I was hoping you’d say that. But brace yourself, now it gets even better! We just saw that using sets, we could match one of several characters at once. But you can even repeat a character or set, reducing the number of expressions needed to handle the above page number example to one. Yes, ONE! Excited? You should be! It works like this: Some so-called special characters, “+”, “?” and “*”, repeat the single element preceding them. (Element means either a single character, a character set, an escape sequence or a group (we’ll learn about those last two later)- in short, any single entity in a regular expression.) These characters are called wildcards or quantifiers. To be more precise, “?” matches 0 or 1 of the preceding element, “*” matches 0 or more of the preceding element and “+” matches 1 or more of the preceding element. A few examples: The expression a? would match either “” (which is the empty string, not strictly useful in this case) or “a”, the expression a+ would match “a”, “aa” or any number of a’s in a row, and, finally, the expression a* would match “a”, “aa” or any number of a’s in a row (Note: it wouldn’t match the empty string!). Same deal for sets: The expression [0-9]+ would match every integer number there is! I know what you’re thinking, and you’re right: If you use that in the above case of matching page numbers, wouldn’t that be the single one expression to match all the page numbers? Yes, the expression Page [0-9]+ of 423 would match every page number in that book!

**Note:** A note on these quantifiers: They generally try to match as much text as possible, so be careful when using them. This is called “greedy behaviour“. I’m sure you get why. It gets problematic when you, say, try to match a tag. Consider, for example, the string "<p class="calibre2">Title here</p>" and let’s say you’d want to match the opening tag (the part between the first pair of angle brackets, a little more on tags later). You’d think that the expression <p.*> would match that tag, but actually, it matches the whole string! (The character “.” is another special character. It matches anything except linebreaks, so, basically, the expression .* would match any single line you can think of.) Instead, try using <p.*?> which makes the quantifier "*" non-greedy. That expression would only match the first opening tag, as intended. There’s actually another way to accomplish this: The expression <p[^>]*> will match that same opening tag- you’ll see why after the next section. Just note that there quite frequently is more than one way to write a regular expression.

10.4.7 Well, these special characters are very neat and all, but what if I wanted to match a dot or a question mark?

You can of course do that: Just put a backslash in front of any special character and it is interpreted as the literal character, without any special meaning. This pair of a backslash followed by a single character is called an escape sequence, and the act of putting a backslash in front of a special character is called escaping that character. An escape sequence is interpreted as a single element. There are of course escape sequences that do more than just escaping special characters, for example ".t" means a tabulator. We’ll get to some of the escape sequences later. Oh, and by the way, concerning those special characters: Consider any character we discuss in this introduction as having some function to be special and thus needing to be escaped if you want the literal character.

10.4.8 So, what are the most useful sets?

Knew you’d ask. Some useful sets are [0-9] matching a single number, [a-z] matching a single lowercase letter, [A-Z] matching a single uppercase letter, [a-zA-Z] matching a single letter and [a-zA-Z0-9] matching a single letter or number. You can also use an escape sequence as shorthand:

```
\d is equivalent to [0-9]
\w is equivalent to [a-zA-Z0-9_]
\s is equivalent to any whitespace
```
Note: “Whitespace” is a term for anything that won’t be printed. These characters include space, tabulator, line feed, form feed and carriage return.

As a last note on sets, you can also define a set as any character but those in the set. You do that by including the character "^" as the very first character in the set. Thus, [^a] would match any character excluding “a”. That’s called complementing the set. Those escape sequence shorthands we saw earlier can also be complemented: "\D" means any non-number character, thus being equivalent to [^0-9]. The other shorthands can be complemented by, you guessed it, using the respective uppercase letter instead of the lowercase one. So, going back to the example <p[^>]*> from the previous section, now you can see that the character set it’s using tries to match any character except for a closing angle bracket.

10.4.9 But if I had a few varying strings I wanted to match, things get complicated?

Fear not, life still is good and easy. Consider this example: The book you’re converting has “Title” written on every odd page and “Author” written on every even page. Looks great in print, right? But in e-books, it’s annoying. You can group whole expressions in normal parentheses, and the character "|" will let you match either the expression to its right or the one to its left. Combine those and you’re done. Too fast for you? Okay, first off, we group the expressions for odd and even pages, thus getting (Title)(Author) as our two needed expressions. Now we make things simpler by using the vertical bar (“|” is called the vertical bar character): If you use the expression (Title|Author) you’ll either get a match for “Title” (on the odd pages) or you’d match “Author” (on the even pages). Well, wasn’t that easy?

You can, of course, use the vertical bar without using grouping parentheses, as well. Remember when I said that quantifiers repeat the element preceding them? Well, the vertical bar works a little differently: The expression “Title/Author” will also match either the string “Title” or the string “Author”, just as the above example using grouping. The vertical bar selects between the entire expression preceding and following it. So, if you wanted to match the strings “Calibre” and “calibre” and wanted to select only between the upper- and lowercase “c”, you’d have to use the expression (c|C)alibre, where the grouping ensures that only the “c” will be selected. If you were to use c|Calibre, you’d get a match on the string “c” or on the string “Calibre”, which isn’t what we wanted. In short: If in doubt, use grouping together with the vertical bar.

10.4.10 You missed…

… wait just a minute, there’s one last, really neat thing you can do with groups. If you have a group that you previously matched, you can use references to that group later in the expression: Groups are numbered starting with 1, and you reference them by escaping the number of the group you want to reference, thus, the fifth group would be referenced as \5. So, if you searched for ([^ ]+) \1 in the string “Test Test”, you’d match the whole string!

10.4.11 In the beginning, you said there was a way to make a regular expression case insensitive?

Yes, I did, thanks for paying attention and reminding me. You can tell calibre how you want certain things handled by using something called flags. You include flags in your expression by using the special construct (?flags go here) where, obviously, you’d replace “flags go here” with the specific flags you want. For ignoring case, the flag is i, thus you include (?i) in your expression. Thus, (?i)test would match “Test”, “tEst”, “TEst” and any case variation you could think of.

Another useful flag lets the dot match any character at all, including the newline, the flag s. If you want to use multiple flags in an expression, just put them in the same statement: (?is) would ignore case and make the dot match all. It doesn’t matter which flag you state first, (?si) would be equivalent to the above.
10.4.12 I think I’m beginning to understand these regular expressions now… how do I use them in calibre?

Conversions

Let’s begin with the conversion settings, which is really neat. In the Search & replace part, you can input a regexp (short for regular expression) that describes the string that will be replaced during the conversion. The neat part is the wizard. Click on the wizard staff and you get a preview of what calibre “sees” during the conversion process. Scroll down to the string you want to remove, select and copy it, paste it into the regexp field on top of the window. If there are variable parts, like page numbers or so, use sets and quantifiers to cover those, and while you’re at it, remember to escape special characters, if there are some. Hit the button labeled Test and calibre highlights the parts it would replace were you to use the regexp. Once you’re satisfied, hit OK and convert. Be careful if your conversion source has tags like this example:

Maybe, but the cops feel like you do, Anita. What’s one more dead vampire? New laws don’t change that. 

<p class="calibre4"> It had only been two years since Addison v. Clark. The court case gave us a revised version of what life was (shamelessly ripped out of this thread83). You’d have to remove some of the tags as well. In this example, I’d recommend beginning with the tag <b class="calibre2">.</b>, now you have to end with the corresponding closing tag (opening tags are <i>tag</i>, closing tags are </i>tag<i>), which is simply the next </i>tag<i> in this case. (Refer to a good HTML manual or ask in the forum if you are unclear on this point.) The opening tag can be described using <b class="calibre2">.*</b>, the closing tag using </i>tag<i>, thus we could remove everything between those tags using <b class="calibre2">.*</b>. But using this expression would be a bad idea, because it removes everything enclosed by <b class="calibre2">-</b> tags (which, by the way, render the enclosed text in bold print), and it’s a fair bet that we’ll remove portions of the book in this way. Instead, include the beginning of the enclosed string as well, making the regular expression <b class="calibre2">.*</b>

The \s with quantifiers are included here instead of explicitly using the spaces as seen in the string to catch any variations of the string that might occur. Remember to check what calibre will remove to make sure you don’t remove any portions you want to keep if you test a new expression. If you only check one occurrence, you might miss a mismatch somewhere else in the text. Also note that should you accidentally remove more or fewer tags than you actually wanted to, calibre tries to repair the damaged code after doing the removal.

Adding books

Another thing you can use regular expressions for is to extract metadata from filenames. You can find this feature in the “Adding books” part of the settings. There’s a special feature here: You can use field names for metadata fields, for example (?P<title>) would indicate that calibre uses this part of the string as book title. The allowed field names are listed in the windows, together with another nice test field. An example: Say you want to import a whole bunch of files named like Classical Texts: The Divine Comedy by Dante Alighieri. mobi. (Obviously, this is already in your library, since we all love classical italian poetry) or Science Fiction epics: The Foundation Trilogy by Isaac Asimov.epub. This is obviously a naming scheme that calibre won’t extract any meaningful data out of - its standard expression for extracting metadata is (?P<title>..) - (?P<author>^[^]+). A regular expression that works here would be [a-zA-Z]+: (?P<title>..) by (?P<author>\+). Please note that, inside the group for the metadata field, you need to use expressions to describe what the field actually matches. And also note that, when using the test field calibre provides, you need to add the file extension to your testing filename, otherwise you won’t get any matches at all, despite using a working expression.

10.4. All about using regular expressions in calibre 197
Bulk editing metadata

The last part is regular expression search and replace in metadata fields. You can access this by selecting multiple books in the library and using bulk metadata edit. Be very careful when using this last feature, as it can do Very Bad Things to your library! Doublecheck that your expressions do what you want them to using the test fields, and only mark the books you really want to change! In the regular expression search mode, you can search in one field, replace the text with something and even write the result into another field. A practical example: Say your library contained the books of Frank Herbert’s Dune series, named after the fashion Dune 1 - Dune, Dune 2 - Dune Messiah and so on. Now you want to get Dune into the series field. You can do that by searching for (.*?) \d+ - .* in the title field and replacing it with \1 in the series field. See what I did there? That’s a reference to the first group you’re replacing the series field with. Now that you have the series all set, you only need to do another search for .*? - in the title field and replace it with "" (an empty string), again in the title field, and your metadata is all neat and tidy. Isn’t that great? By the way, instead of replacing the entire field, you can also append or prepend to the field, so, if you wanted the book title to be prepended with series info, you could do that as well. As you by now have undoubtedly noticed, there’s a checkbox labeled Case sensitive, so you won’t have to use flags to select behaviour here.

Well, that just about concludes the very short introduction to regular expressions. Hopefully I’ll have shown you enough to at least get you started and to enable you to continue learning by yourself- a good starting point would be the Python documentation for regexps84.

One last word of warning, though: Regexps are powerful, but also really easy to get wrong. calibre provides really great testing possibilities to see if your expressions behave as you expect them to. Use them. Try not to shoot yourself in the foot. (God, I love that expression… ) But should you, despite the warning, injure your foot (or any other body parts), try to learn from it.

10.4.13 Quick reference

Quick reference for regexp syntax

This checklist summarizes the most commonly used/hard to remember parts of the regexp engine available in the calibre edit and conversion search/replace features. Note that this engine is more powerful than the basic regexp engine used throughout the rest of calibre.

Character classes

Character classes are useful to represent different groups of characters, succinctly.

Examples:

<table>
<thead>
<tr>
<th>Representation</th>
<th>Class</th>
</tr>
</thead>
<tbody>
<tr>
<td>[a-z]</td>
<td>Lowercase letters. Does not include characters with accent mark and ligatures</td>
</tr>
<tr>
<td>[a-z0-9]</td>
<td>Lowercase letters from a to z or numbers from 0 to 9</td>
</tr>
<tr>
<td>[A-Za-z-]</td>
<td>Uppercase or lowercase letters, or a dash. To include the dash in a class, you must put it at the begining or at the end so as not to confuse it with the hyphen that specifies a range of characters</td>
</tr>
<tr>
<td>^[0-9]</td>
<td>Any character except a digit. The caret (^) placed at the beginning of the class excludes the characters of the class (complemented class)</td>
</tr>
<tr>
<td>[a-z][-][aeiouy]</td>
<td>The lowercase consonants. A class can be included in a class. The characters -- exclude what follows them</td>
</tr>
<tr>
<td>[\w--[\d_]]</td>
<td>All letters (including foreign accented characters). Abbreviated classes can be used inside a class</td>
</tr>
</tbody>
</table>

Example:

`<[^<>]+> to select an HTML tag`

Shorthand character classes

<table>
<thead>
<tr>
<th>Representation</th>
<th>Class</th>
</tr>
</thead>
<tbody>
<tr>
<td>\d</td>
<td>A digit (same as [0-9])</td>
</tr>
<tr>
<td>\D</td>
<td>Any non-numeric character (same as [^0-9])</td>
</tr>
<tr>
<td>\w</td>
<td>An alphanumeric character ([a-zA-Z0-9]) including characters with accent mark and ligatures</td>
</tr>
<tr>
<td>\W</td>
<td>Any “non-word” character</td>
</tr>
<tr>
<td>\s</td>
<td>Space, non-breaking space, tab, return line</td>
</tr>
<tr>
<td>\S</td>
<td>Any “non-whitespace” character</td>
</tr>
<tr>
<td>.</td>
<td>Any character except newline. Use the “dot all” checkbox or the (?s) regexp modifier to include the newline character.</td>
</tr>
</tbody>
</table>

10.4. All about using regular expressions in calibre
The quantifiers

<table>
<thead>
<tr>
<th>Quantifier</th>
<th>Number of occurrences of the expression preceding the quantifier</th>
</tr>
</thead>
<tbody>
<tr>
<td>?</td>
<td>0 or 1 occurrence of the expression. Same as {0,1}</td>
</tr>
<tr>
<td>+</td>
<td>1 or more occurrences of the expression. Same as {1,}</td>
</tr>
<tr>
<td>*</td>
<td>0, 1 or more occurrences of the expression. Same as {0,}</td>
</tr>
<tr>
<td>{n}</td>
<td>Exactly n occurrences of the expression</td>
</tr>
<tr>
<td>{min,max}</td>
<td>Number of occurrences between the minimum and maximum values included</td>
</tr>
<tr>
<td>{min,}</td>
<td>Number of occurrences between the minimum value included and the infinite</td>
</tr>
<tr>
<td>{,max}</td>
<td>Number of occurrences between 0 and the maximum value included</td>
</tr>
</tbody>
</table>

Greed

By default, with quantifiers, the regular expression engine is greedy: it extends the selection as much as possible. This often causes surprises, at first. \? follows a quantifier to make it lazy. Avoid putting two in the same expression, the result can be unpredictable.

Beware of nesting quantifiers, for example, the pattern \((a*)*\), as it exponentially increases processing time.

Alternation

The `|` character in a regular expression is a logical OR. It means that either the preceding or the following expression can match.

Exclusion

Method 1

`pattern_to_exclude(*SKIP)(*FAIL)|pattern_to_select`

Example:

"Blabla"(*SKIP)(*FAIL)|Blabla

selects Blabla, in the strings Blabla or “Blabla or Blabla”, but not in “Blabla”.

Method 2

`pattern_to_exclude\K|(pattern_to_select)`

"Blabla\\K|(Blabla)

selects Blabla, in the strings Blabla or “Blabla or Blabla”, but not in “Blabla”.

Anchors

An anchor is a way to match a logical location in a string, rather than a character. The most useful anchors for text processing are:

\b Designates a word boundary, i.e. a transition from space to non-space character. For example, you can use \bsurd to match the surd but not absurd.

\^ Matches the start of a line (in multi-line mode, which is the default)
Groups

(expression) Capturing group, which stores the selection and can be recalled later in the search or replace patterns with \n, where n is the sequence number of the capturing group (starting at 1 in reading order)

(?!expression) Group that does not capture the selection

(?>expression) Atomic Group: As soon as the expression is satisfied, the regexp engine passes, and if the rest of the pattern fails, it will not backtrack to try other combinations with the expression. Atomic groups do not capture.

(?!expression) Branch reset group: the branches of the alternations included in the expression share the same group numbers

(?!<name>expression) Group named “name”. The selection can be recalled later in the search pattern by (?!P=name) and in the replace by \g<name>. Two different groups can use the same name.

Lookarounds

<table>
<thead>
<tr>
<th>Lookaround</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>?=</td>
<td>Positive lookahead (to be placed after the selection)</td>
</tr>
<tr>
<td>?!</td>
<td>Negative lookahead (to be placed after the selection)</td>
</tr>
<tr>
<td>?&lt;=</td>
<td>Positive lookbehind (to be placed before the selection)</td>
</tr>
<tr>
<td>?&lt;!</td>
<td>Negative lookbehind (to be placed before the selection)</td>
</tr>
</tbody>
</table>

Lookaheads and lookbehinds do not consume characters, they are zero length and do not capture. They are atomic groups: as soon as the assertion is satisfied, the regexp engine passes, and if the rest of the pattern fails, it will not backtrack inside the lookaround to try other combinations.

When looking for multiple matches in a string, at the starting position of each match attempt, a lookbehind can inspect the characters before the current position. Therefore, on the string 123, the pattern (?<=\d) \d (a digit preceded by a digit) should, in theory, select 2 and 3. On the other hand, \d\K\d can only select 2, because the starting position after the first selection is immediately before 3, and there are not enough digits for a second match. Similarly, \d (\d only captures 2. In calibre’s regexp engine practice, the positive lookbehind behaves in the same way, and selects only 2, contrary to theory.

Groups can be placed inside lookarounds, but capture is rarely useful. Nevertheless, if it is useful, it will be necessary to be very careful in the use of a quantifier in a lookbehind: the greed associated with the absence of backtracking can give a surprising capture. For this reason, use \K rather than a positive lookbehind when you have a quantifier (or worse, several) in a capturing group of the positive lookbehind.

Example of negative lookahead:

(?![^<>{}]*[^>])

Placed at the end of the pattern prevents to select within a tag or a style embedded in the file.
Whenever possible, it is always better to “anchor” the lookarounds, to reduce the number of steps necessary to obtain the result.

**Recursion**

<table>
<thead>
<tr>
<th>Representation</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>(?R)</td>
<td>Recursion of the entire pattern</td>
</tr>
<tr>
<td>(?1)</td>
<td>Recursion of the only pattern of the numbered capturing group, here group 1</td>
</tr>
</tbody>
</table>

Recursion is calling oneself. This is useful for balanced queries, such as quoted strings, which can contain embedded quoted strings. Thus, if during the processing of a string between double quotation marks, we encounter the beginning of a new string between double quotation marks, well we know how to do, and we call ourselves. Then we have a pattern like:

\[
\text{start-pattern}(?>\text{atomic sub-pattern}(?>\text{atomic sub-pattern}|(?R))+)?\text{end-pattern}
\]

To select a string between double quotation marks without stopping on an embedded string:

\[
"((?>[^"\"]|(?R))+(^"\")+)"
\]

This template can also be used to modify pairs of tags that can be embedded, such as `<div>` tags.

**Special characters**

<table>
<thead>
<tr>
<th>Representation</th>
<th>Character</th>
</tr>
</thead>
<tbody>
<tr>
<td>\t</td>
<td>tabulation</td>
</tr>
<tr>
<td>\n</td>
<td>line break</td>
</tr>
<tr>
<td>\x20</td>
<td>(breakable) space</td>
</tr>
<tr>
<td>\xa0</td>
<td>no-break space</td>
</tr>
</tbody>
</table>

**Meta-characters**

Meta-characters are those that have a special meaning for the regexp engine. Of these, twelve must be preceded by an escape character, the backslash (\), to lose their special meaning and become a regular character again:

\[
^ . [ ] $ ( ) * + ? | \ \n\]

Seven other meta-characters do not need to be preceded by a backslash (but can be without any other consequence):

\[
( ) ! < > = : \n\]

Special characters lose their status if they are used inside a class (between brackets [ ]). The closing bracket and the dash have a special status in a class. Outside the class, the dash is a simple literal, the closing bracket remains a meta-character.

The slash (/) and the number sign (or hash character) (#) are not meta-characters, they don’t need to be escaped.

In some tools, like regex101.com with the Python engine, double quotes have the special status of separator, and must be escaped, or the options changed. This is not the case in the editor of calibre.
Modes

(\s) Causes the dot (.) to match newline characters as well

(?m) Makes the ^ and $ anchors match the start and end of lines instead of the start and end of the entire string.

10.5 Writing your own plugins to extend calibre’s functionality

calibre has a very modular design. Almost all functionality in calibre comes in the form of plugins. Plugins are used for conversion, for downloading news (though these are called recipes), for various components of the user interface, to connect to different devices, to process files when adding them to calibre and so on. You can get a complete list of all the built-in plugins in calibre by going to Preferences→Advanced→Plugins.

Here, we will teach you how to create your own plugins to add new features to calibre.

---

\(^85\) https://docs.python.org/2/library/re.html
10.5.1 Anatomy of a calibre plugin

A calibre plugin is very simple, it’s just a ZIP file that contains some Python code and any other resources like image files needed by the plugin. Without further ado, let’s see a basic example.

Suppose you have an installation of calibre that you are using to self publish various e-documents in EPUB and MOBI formats. You would like all files generated by calibre to have their publisher set as “Hello world”, here’s how to do it.

Create a file named `__init__.py` (this is a special name and must always be used for the main file of your plugin) and enter the following Python code into it:

```python
import os
from calibre.customize import FileTypePlugin

class HelloWorld(FileTypePlugin):
    name = 'Hello World Plugin'  # Name of the plugin
    description = 'Set the publisher to Hello World for all new conversions'
    supported_platforms = ['windows', 'osx', 'linux']  # Platforms this plugin will run on
    author = 'Acme Inc.'  # The author of this plugin
    version = (1, 0, 0)  # The version number of this plugin
    file_types = set(['epub', 'mobi'])  # The file types that this plugin will be applied to
    on_postprocess = True  # Run this plugin after conversion is complete
    minimum_calibre_version = (0, 7, 53)

    def run(self, path_to_ebook):
        from calibre.ebooks.metadata.meta import get_metadata, set_metadata
        file = open(path_to_ebook, 'r+b')
        ext = os.path.splitext(path_to_ebook)[-1][1:].lower()
        mi = get_metadata(file, ext)
        mi.publisher = 'Hello World'
        set_metadata(file, mi, ext)
        return path_to_ebook
```

That’s all. To add this code to calibre as a plugin, simply run the following in the directory in which you created `__init__.py`:

```bash
calibre-customize -b .
```

Note: On macOS, the command line tools are inside the calibre bundle, for example, if you installed calibre in
You can download the Hello World plugin from helloworld_plugin.zip\(^{86}\).

Every time you use Calibre to convert a book, the plugin’s `run()` method will be called and the converted book will have its publisher set to “Hello World”. This is a trivial plugin, let’s move on to a more complex example that actually adds a component to the user interface.

### 10.5.2 A User Interface plugin

This plugin will be spread over a few files (to keep the code clean). It will show you how to get resources (images or data files) from the plugin ZIP file, allow users to configure your plugin, how to create elements in the Calibre user interface and how to access and query the books database in Calibre.

You can download this plugin from interface_demo_plugin.zip\(^{87}\).

The first thing to note is that this ZIP file has a lot more files in it, explained below, pay particular attention to `plugin-import-name-interface_demo.txt`.

**plugin-import-name-interface_demo.txt** An empty text file used to enable the multi-file plugin magic. This file must be present in all plugins that use more than one .py file. It should be empty and its filename must be of the form: `plugin-import-name-**some_name**.txt`. The presence of this file allows you to import code from the .py files present inside the ZIP file, using a statement like:

```
from calibre_plugins.some_name.some_module import some_object
```

The prefix `calibre_plugins` must always be present. `some_name` comes from the filename of the empty text file. `some_module` refers to `some_module.py` file inside the ZIP file. Note that this importing is just as powerful as regular Python imports. You can create packages and subpackages of .py modules inside the ZIP file, just like you would normally (by defining `__init__.py` in each sub-directory), and everything should “just work”.

The name you use for `some_name` enters a global namespace shared by all plugins, so make it as unique as possible. But remember that it must be a valid Python identifier (only alphabets, numbers and the underscore).

**__init__.py** As before, the file that defines the plugin class

**main.py** This file contains the actual code that does something useful

**ui.py** This file defines the interface part of the plugin

**images/icon.png** The icon for this plugin

**about.txt** A text file with information about the plugin

**translations** A folder containing .mo files with the translations of the user interface of your plugin into different languages. See below for details.

Now let’s look at the code.

**__init__.py**

First, the obligatory `__init__.py` to define the plugin metadata:

---

\(^{86}\) https://calibre-ebook.com/downloads/helloworld_plugin.zip

\(^{87}\) https://calibre-ebook.com/downloads INTERFACE DEMO PLUGIN.zip

---
# The class that all Interface Action plugin wrappers must inherit from

from calibre.customize import InterfaceActionBase

class InterfacePluginDemo(InterfaceActionBase):
    
    This class is a simple wrapper that provides information about the actual
    plugin class. The actual interface plugin class is called InterfacePlugin
    and is defined in the ui.py file, as specified in the actual_plugin field
    below.

    The reason for having two classes is that it allows the command line
    calibre utilities to run without needing to load the GUI libraries.

    name = 'Interface Plugin Demo'
description = 'An advanced plugin demo'
supported_platforms = ['windows', 'osx', 'linux']
author = 'Kovid Goyal'
version = (1, 0, 0)
minimum_calibre_version = (0, 7, 53)

    #: This field defines the GUI plugin class that contains all the code
    #: that actually does something. Its format is module_path:class_name
    #: The specified class must be defined in the specified module.
    actual_plugin = 'calibre_plugins.interface_demo.ui:InterfacePlugin'

    def is_customizable(self):
        
        This method must return True to enable customization via
        Preferences->Plugins
        
        return True

    def config_widget(self):
        
        Implement this method and :meth:`save_settings` in your plugin to
        use a custom configuration dialog.

        This method, if implemented, must return a QWidget. The widget can have
        an optional method validate() that takes no arguments and is called
        immediately after the user clicks OK. Changes are applied if and only
        if the method returns True.

        If for some reason you cannot perform the configuration at this time,
        return a tuple of two strings (message, details), these will be
        displayed as a warning dialog to the user and the process will be
        aborted.

        The base class implementation of this method raises NotImplemented
        error so by default no user configuration is possible.

        # It is important to put this import statement here rather than at the
        # top of the module as importing the config class will also cause the
        # GUI libraries to be loaded, which we do not want when using calibre
        # from the command line
        from calibre_plugins.interface_demo.config import ConfigWidget
        return ConfigWidget()
The only noteworthy feature is the field `actual_plugin`. Since calibre has both command line and GUI interfaces, GUI plugins like this one should not load any GUI libraries in `__init__.py`. The `actual_plugin` field does this for you, by telling calibre that the actual plugin is to be found in another file inside your ZIP archive, which will only be loaded in a GUI context.

Remember that for this to work, you must have a plugin-import-name-some_name.txt file in your plugin ZIP file, as discussed above.

Also there are a couple of methods for enabling user configuration of the plugin. These are discussed below.

**ui.py**

Now let’s look at `ui.py` which defines the actual GUI plugin. The source code is heavily commented and should be self-explanatory:

```python
# The class that all interface action plugins must inherit from
from calibre.gui2.actions import InterfaceAction
from calibre_plugins.interface_demo.main import DemoDialog

class InterfacePlugin(InterfaceAction):

    name = 'Interface Plugin Demo'

    # Declare the main action associated with this plugin
    # The keyboard shortcut can be None if you don't want to use a keyboard shortcut. Remember that currently calibre has no central management for keyboard shortcuts, so try to use an unusual/unused shortcut.
    action_spec = ('Interface Plugin Demo', None, 'Run the Interface Plugin Demo', 'Ctrl+Shift+F1')

    def genesis(self):
        # This method is called once per plugin, do initial setup here

        # Set the icon for this interface action
        # The get_icons function is a builtin function defined for all your plugin code. It loads icons from the plugin zip file. It returns QIcon objects, if you want the actual data, use the analogous get_resources builtin function.
        #
        # Note that if you are loading more than one icon, for performance, you should pass a list of names to get_icons. In this case, get_icons
```

# will return a dictionary mapping names to QIcons. Names that
# are not found in the zip file will result in null QIcons.
icon = get_icons('images/icon.png')

# The qaction is automatically created from the action_spec defined
# above
self.qaction.setIcon(icon)
self.qaction.triggered.connect(self.show_dialog)

def show_dialog(self):
    # The base plugin object defined in __init__.py
    base_plugin_object = self.interface_action_base_plugin
    # Show the config dialog
    # The config dialog can also be shown from within
    # Preferences->Plugins, which is why the do_user_config
    # method is defined on the base plugin class
    do_user_config = base_plugin_object.do_user_config
    do_user_config = base_plugin_object.do_user_config
    d = DemoDialog(self.gui, self.qaction.icon(), do_user_config)
    d.show()

def apply_settings(self):
    from calibre_plugins.interface_demo.config import prefs
    # In an actual non trivial plugin, you would probably need to
    # do something based on the settings in prefs
    prefs

main.py

The actual logic to implement the Interface Plugin Demo dialog.

from PyQt5.Qt import QDialog, QVBoxLayout, QPushButton, QMessageBox, QLabel
from calibre_plugins.interface_demo.config import prefs
class DemoDialog(QDialog):
    def __init__(self, gui, icon, do_user_config):
        QDialog.__init__(self, gui)
        self.gui = gui
        self.do_user_config = do_user_config

        # The current database shown in the GUI
        # db is an instance of the class LibraryDatabase from db/legacy.py
        # This class has many, many methods that allow you to do a lot of
        # things. For most purposes you should use db.new_api, which has
        # a much nicer interface from db/cache.py
        self.db = gui.current_db

        self.l = QVBoxLayout()
        self.setLayout(self.l)
```python
self.label = QLabel(prefs['hello_world_msg'])
self.l.addWidget(self.label)

def about(self):
    # Get the about text from a file inside the plugin zip file
    # The get_resources function is a built-in function defined for all your
    # plugin code. It loads files from the plugin zip file. It returns
    # the bytes from the specified file.
    #
    # Note that if you are loading more than one file, for performance, you
    # should pass a list of names to get_resources. In this case,
    # get_resources will return a dictionary mapping names to bytes. Names that
    # are not found in the zip file will not be in the returned dictionary.
    text = get_resources('about.txt')
    QMessageBox.about(self, 'About the Interface Plugin Demo',
                       text.decode('utf-8'))

def marked(self):
    ''' Show books with only one format in the calibre GUI'''
    db = self.db.new_api
    matched_ids = {book_id for book_id in db.all_book_ids()
                   if len(db.formats(book_id)) == 1}
    # Mark the records with the matching ids
    # new_api does not know anything about marked books, so we use the full
    # db object
    self.db.set_marked_ids(matched_ids)
```

(continues on next page)
# Tell the GUI to search for all marked records
self.gui.search.setEditText('marked:true')
self.gui.search.do_search()

def view(self):
    ''' View the most recently added book '''
    most_recent = most_recent_id = None
    db = self.db.new_api
    for book_id, timestamp in db.all_field_for('timestamp', db.all_book_ids()).iteritems():
        if most_recent is None or timestamp > most_recent:
            most_recent = timestamp
            most_recent_id = book_id

    if most_recent_id is not None:
        # Get a reference to the View plugin
        view_plugin = self.gui.iactions['View']
        # Ask the view plugin to launch the viewer for row_number
        view_plugin._view_calibre_books([most_recent_id])

    def update_metadata(self):
        ''' Set the metadata in the files in the selected book's record to
           match the current metadata in the database. '''
        from calibre.ebooks.metadata.meta import set_metadata
        from calibre.gui2 import error_dialog, info_dialog

        # Get currently selected books
        rows = self.gui.library_view.selectionModel().selectedRows()
        if not rows or len(rows) == 0:
            return error_dialog(self.gui, 'Cannot update metadata',
                                'No books selected', show=True)

        # Map the rows to book ids
        ids = list(map(self.gui.library_view.model().id, rows))
        db = self.db.new_api
        for book_id in ids:
            # Get the current metadata for this book from the db
            mi = db.get_metadata(book_id, get_cover=True, cover_as_data=True)
            fmts = db.formats(book_id)
            if not fmts:
                continue

            for fmt in fmts:
                ffile = db.format(book_id, fmt, as_file=True)
                ffile.seek(0)
                # Set metadata in the format
                set_metadata(ffile, mi, fmt)
                ffile.seek(0)
                # Now replace the file in the calibre library with the updated
                # file. We don't use add_format_with_hooks as the hooks were
                # already run when the file was first added to calibre.
                db.add_format(book_id, fmt, ffile, run_hooks=False)

        info_dialog(self, 'Updated files',
                    (continues on next page)
Getting resources from the plugin ZIP file

calibre’s plugin loading system defines a couple of built-in functions that allow you to conveniently get files from the plugin ZIP file.

`get_resources(name_or_list_of_names)` This function should be called with a list of paths to files inside the ZIP file. For example to access the file icon.png in the directory images in the ZIP file, you would use: `images/icon.png`. Always use a forward slash as the path separator, even on windows. When you pass in a single name, the function will return the raw bytes of that file or None if the name was not found in the ZIP file. If you pass in more than one name then it returns a dict mapping the names to bytes. If a name is not found, it will not be present in the returned dict.

`get_icons(name_or_list_of_names)` A convenience wrapper for `get_resources()` that creates QIcon objects from the raw bytes returned by `get_resources`. If a name is not found in the ZIP file the corresponding QIcon will be null.

Enabling user configuration of your plugin

To allow users to configure your plugin, you must define three methods in your base plugin class, `is_customizable`, `config_widget` and `save_settings` as shown below:

```python
def is_customizable(self):
    '''
    This method must return True to enable customization via Preferences->Plugins
    '''
    return True

def config_widget(self):
    '''
    Implement this method and :meth:`save_settings` in your plugin to use a custom configuration dialog.

    This method, if implemented, must return a QWidget. The widget can have an optional method `validate()` that takes no arguments and is called immediately after the user clicks OK. Changes are applied if and only if the method returns `True`

    If for some reason you cannot perform the configuration at this time, return a tuple of two strings (message, details), these will be displayed as a warning dialog to the user and the process will be aborted.

    The base class implementation of this method raises `NotImplementedError`
    '''
```

(continued on next page)
so by default no user configuration is possible.

```
# It is important to put this import statement here rather than at the
# top of the module as importing the config class will also cause the
# GUI libraries to be loaded, which we do not want when using calibre
# from the command line
from calibre_plugins.interface_demo.config import ConfigWidget
return ConfigWidget()
```

def save_settings(self, config_widget):
    
    Save the settings specified by the user with config_widget.

    
    config_widget.save_settings()

    # Apply the changes
    ac = self.actual_plugin_
    if ac is not None:
        ac.apply_settings()

calibre has many different ways to store configuration data (a legacy of its long history). The recommended way is to use the :class:`JSONConfig` class, which stores your configuration information in a .json file.

The code to manage configuration data in the demo plugin is in config.py:

```python
from PyQt5.Qt import QWidget, QHBoxLayout, QLabel, QLineEdit
from calibre.utils.config import JSONConfig

# This is where all preferences for this plugin will be stored
# Remember that this name (i.e. plugins/interface_demo) is also
# in a global namespace, so make it as unique as possible.
# You should always prefix your config file name with plugins/,
# so as to ensure you dont accidentally clobber a calibre config file
prefs = JSONConfig('plugins/interface_demo')

# Set defaults
prefs.defaults['hello_world_msg'] = 'Hello, World!

class ConfigWidget(QWidget):
    
    def __init__(self):
        QWidget.__init__(self)
        self.l = QHBoxLayout()
        self.setLayout(self.l)
        self.label = QLabel('Hello world &message: ')
        self.l.addWidget(self.label)
        self.msg = QLineEdit(self)
        self.msg.setText(prefs['hello_world_msg'])
        self.l.addWidget(self.msg)
        self.label.setBuddy(self.msg)
```

def save_settings(self):
    prefs['hello_world_msg'] = unicode(self.msg.text())

The prefs object is now available throughout the plugin code by a simple:

from calibre_plugins.interface_demo.config import prefs

You can see the prefs object being used in main.py:

def config(self):
    self.do_user_config(parent=self)
    # Apply the changes
    self.label.setText(prefs['hello_world_msg'])

10.5.3 Edit book plugins

Now let’s change gears for a bit and look at creating a plugin to add tools to the calibre book editor. The plugin is available here: editor_demo_plugin.zip88.

The first step, as for all plugins is to create the import name empty txt file, as described above (page 205). We shall name the file plugin-import-name-editor_plugin_demo.txt.

Now we create the mandatory __init__.py file that contains metadata about the plugin – its name, author, version, etc.

from calibre.customize import EditBookToolPlugin
class DemoPlugin(EditBookToolPlugin):
    name = 'Edit Book plugin demo'
    version = (1, 0, 0)
    author = 'Kovid Goyal'
    supported_platforms = ['windows', 'osx', 'linux']
    description = 'A demonstration of the plugin interface for the ebook editor'
    minimum_calibre_version = (1, 46, 0)

A single editor plugin can provide multiple tools each tool corresponds to a single button in the toolbar and entry in the Plugins menu in the editor. These can have sub-menus in case the tool has multiple related actions.

The tools must all be defined in the file main.py in your plugin. Every tool is a class that inherits from the calibre.gui2.tweak_book.plugin.Tool (page 342) class. Let’s look at main.py from the demo plugin, the source code is heavily commented and should be self-explanatory. Read the API documents of the calibre.gui2.tweak_book.plugin.Tool (page 342) class for more details.

main.py

Here we will see the definition of a single tool that will multiply all font sizes in the book by a number provided by the user. This tool demonstrates various important concepts that you will need in developing your own plugins, so you should read the (heavily commented) source code carefully.

88 https://calibre-ebook.com/downloads/editor_demo_plugin.zip
from PyQt5.Qt import QAction, QInputDialog
from cssutils.css import CSSRule
# The base class that all tools must inherit from
from calibre.gui2.tweak_book.plugin import Tool
from calibre import force_unicode
from calibre.gui2 import error_dialog
from calibre.ebooks.oeb.polish.container import OEB_DOCS, OEB_STYLES, serialize

class DemoTool(Tool):

    #: Set this to a unique name it will be used as a key
    name = 'demo-tool'

    #: If True the user can choose to place this tool in the plugins toolbar
    allowed_in_toolbar = True

    #: If True the user can choose to place this tool in the plugins menu
    allowed_in_menu = True

    def create_action(self, for_toolbar=True):
        # Create an action, this will be added to the plugins toolbar and
        # the plugins menu
        ac = QAction(get_icons('images/icon.png'), 'Magnify fonts', self.gui)  # noqa
        if not for_toolbar:
            # Register a keyboard shortcut for this toolbar action. We only
            # register it for the action created for the menu, not the toolbar,
            # to avoid a double trigger
            self.register_shortcut(ac, 'magnify-fonts-tool', default_keys=('Ctrl+Shift+Alt+D',))
        ac.triggered.connect(self.ask_user)
        return ac

    def ask_user(self):
        # Ask the user for a factor by which to multiply all font sizes
        factor, ok = QInputDialog.getDouble(self.gui, 'Enter a magnification factor', 'Allow font sizes in the book will be multiplied by the specified factor', value=2, min=0.1, max=4)
        if ok:
            # Ensure any in progress editing the user is doing is present in the container
            self.boss.commit_all_editors_to_container()
            try:
                self.magnify_fonts(factor)
            except Exception:
                # Something bad happened report the error to the user
                import traceback
                error_dialog(self.gui, _('Failed to magnify fonts'), _('Failed to magnify fonts, click "Show details" for more info'), det_msg=traceback.format_exc(), show=True)
                # Revert to the saved restore point
                self.boss.revert_requested(self.boss.global_undo.previous_container)

(continues on next page)
else:
    # Show the user what changes we have made, allowing her to
    # revert them if necessary
    self.boss.show_current_diff()
    # Update the editor UI to take into account all the changes we
    # have made
    self.boss.apply_container_update_to_gui()

def magnify_fonts(self, factor):
    # Magnify all font sizes defined in the book by the specified factor
    # First we create a restore point so that the user can undo all changes
    # we make.
    self.boss.add_savepoint('Before: Magnify fonts')

    container = self.current_container  # The book being edited as a container

    # Iterate over all style declarations in the book, this means css
    # stylesheets, <style> tags and style="" attributes
    for name, media_type in container.mime_map.iteritems():
        if media_type in OEB_STYLES:
            # A stylesheet. Parsed stylesheets are cssutils CSSStyleSheet
            # objects.
            self.magnify_stylesheet(container.parsed(name), factor)
            container.dirty(name)  # Tell the container that we have changed the

        elif media_type in OEB_DOCS:
            # A HTML file. Parsed HTML files are lxml elements
            for style_tag in container.parsed(name).xpath('//*[local-name="style"]
                ->css'):
                if style_tag.text and style_tag.get('type', None) in {None, 'text/
                    print=True}:
                    sheet = container.parse_css(style_tag.text)
                    self.magnify_stylesheet(sheet, factor)
                    style_tag.text = serialize(sheet, 'text/css', pretty_

                    container.dirty(name)  # Tell the container that we have

        # Process inline style attributes
        block = container.parse_css(elem.get('style'), is_
            declaration=True)
        self.magnify_declaration(block, factor)
        elem.set('style', force_unicode(block.getCssText(separator=' '),

    def magnify_stylesheet(self, sheet, factor):
        # Magnify all fonts in the specified stylesheet by the specified
        # factor.
        for rule in sheet.cssRules.rulesOfType(CSSRule.STYLE_RULE):
            self.magnify_declaration(rule.style, factor)

    def magnify_declaration(self, style, factor):
        # Magnify all fonts in the specified style declaration by the specified

(continues on next page)
Let’s break down `main.py`. We see that it defines a single tool, named `Magnify fonts`. This tool will ask the user for a number and multiply all font sizes in the book by that number.

The first important thing is the tool name which you must set to some relatively unique string as it will be used as the key for this tool.

The next important entry point is the `calibre.gui2.tweak_book.plugin.Tool.create_action()` method (page 324). This method creates the QAction objects that appear in the plugins toolbar and plugin menu. It also optionally assigns a keyboard shortcut that the user can customize. The triggered signal from the QAction is connected to the ask_user() method that asks the user for the font size multiplier, and then runs the magnification code.

The magnification code is well commented and fairly simple. The main things to note are that you get a reference to the editor window as `self.gui` and the editor `Boss` as `self.boss`. The `Boss` is the object that controls the editor user interface. It has many useful methods, that are documented in the `calibre.gui2.tweak_book.boss.Boss` class.

Finally, there is `self.current_container` which is a reference to the book being edited as a `calibre.ebooks.oeb.polish.container.Container` object. This represents the book as a collection of its constituent HTML/CSS/image files and has convenience methods for doing many useful things. The container object and various useful utility functions that can be reused in your plugin code are documented in `API documentation for the e-book editing tools` (page 335).

### 10.5.4 Adding translations to your plugin

You can have all the user interface strings in your plugin translated and displayed in whatever language is set for the main calibre user interface.

The first step is to go through your plugin’s source code and mark all user visible strings as translatable, by surrounding them in `_()`. For example:

```python
action_spec = (_('My plugin'), None, _('My plugin is cool'), None)
```

Then use some program to generate .po files from your plugin source code. There should be one .po file for every language you want to translate into. For example: de.po for German, fr.po for French and so on. You can use the poedit program for this.

Send these .po files to your translators. Once you get them back, compile them into .mo files. You can again use poedit for that, or just do:

```
calibre-debug -c "from calibre.translations.msgfmt import main; main()" filename.po
```

---

89 https://poedit.net/
Put the .mo files into the `translations` folder in your plugin.

The last step is to simply call the function `load_translations()` at the top of your plugin’s .py files. For performance reasons you should only call this function in those .py files that actually have translatable strings. So in a typical User Interface plugin you would call it at the top of `ui.py` but not `__init__.py`.

You can test the translations of your plugins by changing the user interface language in calibre under Preferences→Interface→Look & feel or by running calibre like this:

```
CALIBRE_OVERRIDE_LANG=de calibre
```

Replace `de` with the language code of the language you want to test.

### 10.5.5 The plugin API

As you may have noticed above, a plugin in calibre is a class. There are different classes for the different types of plugins in calibre. Details on each class, including the base class of all plugins can be found in API documentation for plugins (page 229).

Your plugin is almost certainly going to use code from calibre. To learn how to find various bits of functionality in the calibre code base, read the section on the calibre Code layout (page 322).

### 10.5.6 Debugging plugins

The first, most important step is to run calibre in debug mode. You can do this from the command line with:

```
calibre-debug -g
```

Or from within calibre by right-clicking the Preferences button or using the `Ctrl+Shift+R` keyboard shortcut.

When running from the command line, debug output will be printed to the console, when running from within calibre the output will go to a txt file.

You can insert print statements anywhere in your plugin code, they will be output in debug mode. Remember, this is Python, you really shouldn’t need anything more than print statements to debug ;) I developed all of calibre using just this debugging technique.

You can quickly test changes to your plugin by using the following command line:

```
calibre-debug -s; calibre-customize -b /path/to/your/plugin/directory; calibre
```

This will shutdown a running calibre, wait for the shutdown to complete, then update your plugin in calibre and relaunch calibre.

### 10.5.7 More plugin examples

You can find a list of many, sophisticated calibre plugins [here]({#}).

### 10.5.8 Sharing your plugins with others

If you would like to share the plugins you have created with other users of calibre, post your plugin in a new thread in the calibre plugins forum[91].

---

10.6 Typesetting Math in e-books

The calibre E-book viewer has the ability to display math embedded in e-books (EPUB and HTML files). You can typeset the math directly with TeX or MathML or AsciiMath. The calibre E-book viewer uses the excellent MathJax library to do this. This is a brief tutorial on creating e-books with math in them that work well with the calibre E-book viewer.

10.6.1 A simple HTML file with mathematics

You can write mathematics inline inside a simple HTML file and the calibre E-book viewer will render it into properly typeset mathematics. In the example below, we use TeX notation for mathematics. You will see that you can use normal TeX commands, with the small caveat that ampersands and less than and greater than signs have to be written as & and &lt; respectively.

The first step is to tell calibre that this will contains maths. You do this by adding the following snippet of code to the <head> section of the HTML file:

```html
<script type="text/x-mathjax-config"></script>
```

That’s it, now you can type mathematics just as you would in a .tex file. For example, here are Lorentz’s equations:

```
<h2>The Lorenz Equations</h2>

\begin{align}
\dot{x} & = \sigma(y-x) \\
\dot{y} & = \rho x - y - xz \\
\dot{z} & = -\beta z + xy
\end{align}
```

This snippet looks like the following screen shot in the calibre E-book viewer.

![Fig. 1: The Lorenz Equations](https://www.mathjax.org)

The complete HTML file, with more equations and inline mathematics is reproduced below. You can convert this HTML file to EPUB in calibre to end up with an e-book you can distribute easily to other people.

```html
<!DOCTYPE html>
<html>
<!-- Copyright (c) 2012 Design Science, Inc. -->
<head>
<title>Math Test Page</title>
</head>
<!-- This file contains some mathematics. The calibre E-book viewer will render it into properly typeset mathematics.

The first step is to tell calibre that this will contain maths. You do this by adding the following snippet of code to the
<head> section of the HTML file:

```html
<script type="text/x-mathjax-config"></script>
```

That’s it, now you can type mathematics just as you would in a .tex file. For example, here are Lorentz’s equations:

```latex
\begin{align}
\dot{x} & = \sigma(y-x) \\
\dot{y} & = \rho x - y - xz \\
\dot{z} & = -\beta z + xy
\end{align}
```

This snippet looks like the following screen shot in the calibre E-book viewer.

```
\begin{align}
\dot{x} & = \sigma(y-x) \\
\dot{y} & = \rho x - y - xz \\
\dot{z} & = -\beta z + xy
\end{align}
```

Fig. 1: The Lorenz Equations

The complete HTML file, with more equations and inline mathematics is reproduced below. You can convert this HTML file to EPUB in calibre to end up with an e-book you can distribute easily to other people.

```html
<!DOCTYPE html>
<html>
<!-- Copyright (c) 2012 Design Science, Inc. -->
<head>
<title>Math Test Page</title>
</head>
```

92 https://www.mathjax.org

(continues on next page)
Sample Equations

The Lorenz Equations

\begin{align}
\dot{x} &= \sigma(y-x) \label{lorenz} \\
\dot{y} &= \rho x - y - xz \\
\dot{z} &= -\beta z + xy
\end{align}

The Cauchy-Schwarz Inequality

\[
\left( \sum_{k=1}^n a_k b_k \right)^2 \leq \left( \sum_{k=1}^n a_k^2 \right) \left( \sum_{k=1}^n b_k^2 \right)
\]

A Cross Product Formula

\[
\mathbf{V}_1 \times \mathbf{V}_2 = \begin{vmatrix}
\mathbf{i} & \mathbf{j} & \mathbf{k} \\
\frac{\partial X}{\partial u} & \frac{\partial Y}{\partial u} & 0 \\
\frac{\partial X}{\partial v} & \frac{\partial Y}{\partial v} & 0
\end{vmatrix}
\]

The probability of getting \(k\) heads when flipping \(n\) coins is:

\[
P(E) = \binom{n}{k} p^k (1-p)^{n-k}
\]

10.6. Typesetting Math in e-books
<h2>An Identity of Ramanujan</h2>

\[
\frac{1}{\left(\sqrt{\phi \sqrt{5}}-\phi\right) e^{\frac{2}{5} \pi}} =
1+\frac{e^{-2\pi}}{1+\frac{e^{-4\pi}}{1+\frac{e^{-6\pi}}{1+\frac{e^{-8\pi}}{1+\ldots}}}}
\]

<h2>A Rogers–Ramanujan Identity</h2>

\[
1 + \frac{q^2}{1-q} + \frac{q^6}{(1-q)(1-q^2)} + \cdots =
\prod_{j=0}^{\infty} \frac{1}{(1-q^{5j+2})(1-q^{5j+3})}, \quad \text{for } |q| < 1.
\]

<h2>Maxwell’s Equations</h2>

\[
\begin{align}
\nabla \times \vec{B} - \frac{1}{c} \frac{\partial \vec{E}}{\partial t} &= \frac{4\pi}{c} \vec{j} \\
\nabla \cdot \vec{E} &= 4\pi \rho \\
\nabla \times \vec{E} + \frac{1}{c} \frac{\partial \vec{B}}{\partial t} &= \vec{0} \\
\nabla \cdot \vec{B} &= 0
\end{align}
\]

<h2>In-line Mathematics</h2>

While display equations look good for a page of samples, the ability to mix math and text in a paragraph is also important. This expression \((\sqrt{3x-1}+(1+x)^2)\) is an example of an inline equation. As you see, equations can be used this way as well, without unduly disturbing the spacing between lines.

<h2>References to equations</h2>

Here is a reference to the Lorenz Equations (\ref{lorenz}). Clicking on the equation number will take you back to the equation.

10.6.2 More information

Since the calibre E-book viewer uses the MathJax library to render mathematics, the best place to find out more about math in e-books and get help is the MathJax website.\footnote{https://www.mathjax.org}
10.7 Creating AZW3 • EPUB • MOBI catalogs

calibre’s Create catalog feature enables you to create a catalog of your library in a variety of formats. This help file describes cataloging options when generating a catalog in AZW3, EPUB and MOBI formats.

- Selecting books to catalog (page 221)
- Included sections (page 222)
- Prefixes (page 222)
- Excluded books (page 223)
- Excluded genres (page 223)
- Other options (page 224)
- Custom catalog covers (page 225)
- Additional help resources (page 225)

10.7.1 Selecting books to catalog

If you want all of your library cataloged, remove any search or filtering criteria in the main window. With a single book selected, all books in your library will be candidates for inclusion in the generated catalog. Individual books may be excluded by various criteria; see the Excluded genres (page 223) section below for more information.

If you want only some of your library cataloged, you have two options:

- Create a multiple selection of the books you want cataloged. With more than one book selected in calibre’s main window, only the selected books will be cataloged.
- Use the Search field or the Tag browser to filter the displayed books. Only the displayed books will be cataloged.

To begin catalog generation, select the menu item Convert books > Create a catalog of the books in your calibre library. You may also add a Create Catalog button to a toolbar in Preferences > Interface > Toolbars for easier access to the Generate catalog dialog.

In Catalog options, select AZW3, EPUB or MOBI as the Catalog format. In the Catalog title field, provide a name that will be used for the generated catalog. If a catalog of the same name and format already exists, it will be replaced with the newly-generated catalog.
Enabling *Send catalog to device automatically* will download the generated catalog to a connected device upon completion.

### 10.7.2 Included sections

Sections enabled by a checkmark will be included in the generated catalog:

- **Authors** - all books, sorted by author, presented in a list format. Non-series books are listed before series books.
- **Titles** - all books, sorted by title, presented in a list format.
- **Series** - all books that are part of a series, sorted by series, presented in a list format.
- **Genres** - individual genres presented in a list, sorted by Author and Series.
- **Recently Added** - all books, sorted in reverse chronological order. List includes books added in the last 30 days, then a month-by-month listing of added books.
- **Descriptions** - detailed description page for each book, including a cover thumbnail and comments. Sorted by author, with non-series books listed before series books.

### 10.7.3 Prefixes

Prefix rules allow you to add a prefix to book listings when certain criteria are met. For example, you might want to mark books you’ve read with a checkmark, or books on your wishlist with an X.

The checkbox in the first column enables the rule. *Name* is a rule name that you provide. *Field* is either *Tags* or a custom column from your library. *Value* is the content of *Field* to match. When a prefix rule is satisfied, the book will be marked with the selected *Prefix*.
Three prefix rules have been specified in the example above:

1. *Read book* specifies that a book with any date in a custom column named *Last read* will be prefixed with a checkmark symbol.
2. *Wishlist* item specifies that any book with a *Wishlist* tag will be prefixed with an X symbol.
3. *Library* books specifies that any book with a value of True (or Yes) in a custom column *Available in Library* will be prefixed with a double arrow symbol.

The first matching rule supplies the prefix. Disabled or incomplete rules are ignored.

### 10.7.4 Excluded books

Exclusion rules allow you to specify books that will not be cataloged.

The checkbox in the first column enables the rule. *Name* is a rule name that you provide. *Field* is either *Tags* or a custom column in your library. *Value* is the content of *Field* to match. When an exclusion rule is satisfied, the book will be excluded from the generated catalog.

Two exclusion rules have been specified in the example above:

1. The *Catalogs* rule specifies that any book with a *Catalog* tag will be excluded from the generated catalog.
2. The *Archived Books* rule specifies that any book with a value of *Archived* in the custom column *Status* will be excluded from the generated catalog.

All rules are evaluated for every book. Disabled or incomplete rules are ignored.

### 10.7.5 Excluded genres

When the catalog is generated, tags in your database are used as genres. For example, you may use the tags *Fiction* and *Nonfiction*. These tags become genres in the generated catalog, with books listed under their respective genre lists based on their assigned tags. A book will be listed in every genre section for which it has a corresponding tag.

You may be using certain tags for other purposes, perhaps a + to indicate a read book, or a bracketed tag like *[Amazon Freebie]* to indicate a book’s source. The *Excluded genres* regex allows you to specify tags that you don’t want
used as genres in the generated catalog. The default exclusion regex pattern `\[.+\]+` excludes any tags of the form `[tag]`, as well as excluding `, the default tag for read books, from being used as genres in the generated catalog.

You can also use an exact tag name in a regex. For example, `[Amazon Freebie]` or `[Project Gutenberg]`. If you want to list multiple exact tags for exclusion, put a pipe (vertical bar) character between them: `[Amazon Freebie] | [Project Gutenberg].

Results of regex shows you which tags will be excluded when the catalog is built, based on the tags in your database and the regex pattern you enter. The results are updated as you modify the regex pattern.

### 10.7.6 Other options

![Other options]

*Catalog cover* specifies whether to generate a new cover or use an existing cover. It is possible to create a custom cover for your catalogs - see Custom catalog covers (page 225) for more information. If you have created a custom cover that you want to reuse, select *Use existing cover*. Otherwise, select *Generate new cover*.

*Extra Description note* specifies a custom column’s contents to be inserted into the Description page, next to the cover thumbnail. For example, you might want to display the date you last read a book using a *Last Read* custom column. For advanced use of the Description note feature, see this post in the calibre forum.  

*Thumb width* specifies a width preference for cover thumbnails included with Descriptions pages. Thumbnails are cached to improve performance. To experiment with different widths, try generating a catalog with just a few books until you’ve determined your preferred width, then generate your full catalog. The first time a catalog is generated with a new thumbnail width, performance will be slower, but subsequent builds of the catalog will take advantage of the thumbnail cache.

*Merge with Comments* specifies a custom column whose content will be non-destructively merged with the Comments metadata during catalog generation. For example, you might have a custom column *Author bio* that you’d like to append to the Comments metadata. You can choose to insert the custom column contents before or after the Comments section, and optionally separate the appended content with a horizontal rule separator. Eligible custom column types include `text`, `comments`, and `composite`.

---

10.7.7 Custom catalog covers

With the Generate Cover plugin\(^95\) installed, you can create custom covers for your catalog. To install the plugin, go to Preferences > Advanced > Plugins > Get new plugins.

10.7.8 Additional help resources

For more information on calibre’s Catalog feature, see the MobileRead forum sticky Creating Catalogs - Start here\(^96\), where you can find information on how to customize the catalog templates, and how to submit a bug report.

To ask questions or discuss calibre’s Catalog feature with other users, visit the MobileRead forum Calibre Catalogs\(^97\).

10.8 Virtual libraries

In calibre, a virtual library is a way to tell calibre to open only a subset of a normal library. For example, you might want to only work with books by a certain author, or books having only a certain tag. Using virtual libraries is the preferred way of partitioning your large book collection into smaller sub collections. It is superior to splitting up your library into multiple smaller libraries as, when you want to search through your entire collection, you can simply go back to the full library. There is no way to search through multiple separate libraries simultaneously in calibre.

A virtual library is different from a simple search. A search will only restrict the list of books shown in the book list. A virtual library does that, and in addition it also restricts the entries shown in the Tag browser to the left. The Tag browser will only show tags, authors, series, publishers, etc. that come from the books in the virtual library. A virtual library thus behaves as though the actual library contains only the restricted set of books.

\(^95\) https://www.mobileread.com/forums/showthread.php?t=124219
\(^96\) https://www.mobileread.com/forums/showthread.php?t=118556
\(^97\) https://www.mobileread.com/forums/forumdisplay.php?f=236
10.8.1 Creating Virtual libraries

To use a virtual library click the Virtual library button located to the left of the Search bar and select the Create Virtual library option. As a first example, let’s create a virtual library that shows us only the books by a particular author. Click the Authors link as shown in the image below and choose the author you want to use and click OK.

The Create Virtual library dialog has been filled in for you. Click OK and you will see that a new Virtual library has been created, and automatically switched to, that displays only the books by the selected author. As far as calibre is concerned, it is as if your library contains only the books by the selected author.

You can switch back to the full library at any time by once again clicking the Virtual library and selecting the entry named <None>.

Virtual libraries are based on searches. You can use any search as the basis of a virtual library. The virtual library will contain only the books matched by that search. First, type in the search you want to use in the Search bar or build a search using the Tag browser. When you are happy with the returned results, click the Virtual library button, choose Create library and enter a name for the new virtual library. The virtual library will then be created based on the search you just typed in. Searches are very powerful, for examples of the kinds of things you can do with them, see The search interface (page 12).

Examples of useful Virtual libraries

- Books added to calibre in the last day:: date:>1daysago
- Books added to calibre in the last month:: date:>30daysago
- Books with a rating of 5 stars:: rating:5
- Books with a rating of at least 4 stars:: rating:>=4
- Books with no rating:: rating:false
- Periodicals downloaded by the Fetch News function in calibre:: tags:=News and author:=calibre
- Books with no tags:: tags:false
- Books with no covers:: cover:false
10.8.2 Working with Virtual libraries

You can edit a previously created virtual library or remove it, by clicking the Virtual library and choosing the appropriate action.

You can tell calibre that you always want to apply a particular virtual library when the current library is opened, by going to Preferences→Interface→Behavior.

You can quickly use the current search as a temporary virtual library by clicking the Virtual library button and choosing the "current search" entry.

You can display all available virtual libraries as tabs above the book list. This is particularly handy if you like switching between virtual libraries very often. Click the Virtual library button and select Show virtual libraries as tabs. You can re-arrange the tabs by drag and drop and close ones you do not want to see. Closed tabs can be restored by right-clicking on the tab bar.

10.8.3 Using Virtual libraries in searches

You can search for books that are in a virtual library using the vl: prefix. For example, vl:Read will find all the books in the Read virtual library. The search vl:Read and vl:"Science Fiction" will find all the books that are in both the Read and Science Fiction virtual libraries.

The value following vl: must be the name of a virtual library. If the virtual library name contains spaces then surround it with quotes.

One use for a virtual library search is in the content server. In Preferences→Sharing over the net→Require username/password you can limit the calibre libraries visible to a user. For each visible library you can specify a search expression to further limit which books are seen. Use vl:"Virtual library name" to limit the books to those in a virtual library.

10.8.4 Using additional restrictions

You can further restrict the books shown in a Virtual library by using Additional restrictions. An additional restriction is saved search you previously created that can be applied to the current Virtual library to further restrict the books shown in a virtual library. For example, say you have a Virtual library for books tagged as Historical Fiction and a saved search that shows you unread books, you can click the Virtual Library button and choose the Additional restriction option to show only unread Historical Fiction books. To learn about saved searches, see Saving searches (page 14).
Customizing calibre

Calibre has a highly modular design. Various parts of it can be customized. You can learn how to create recipes to add new sources of online content to calibre in the Section Adding your favorite news website (page 25). Here, you will learn, first, how to use environment variables and tweaks to customize calibre’s behavior, and then how to specify your own static resources like icons and templates to override the defaults and finally how to use plugins to add functionality to calibre.

- Environment variables (page 257)
- Tweaks (page 258)
- Overriding icons, templates, et cetera (page 268)
- Creating your own icon theme for calibre (page 268)
- Customizing calibre with plugins (page 269)

### 11.1 API documentation for plugins

Defines various abstract base classes that can be subclassed to create powerful plugins. The useful classes are:

- Plugin (page 230)
- FileTypePlugin (page 232)
- Metadata plugins (page 233)
- Catalog plugins (page 233)
- Metadata download plugins (page 234)
- Conversion plugins (page 237)
11.1.1 Plugin

```python
class calibre.customize.Plugin(plugin_path):
    A calibre plugin. Useful members include:
    • self.plugin_path: Stores path to the ZIP file that contains this plugin or None if it is a builtin plugin
    • self.site_customization: Stores a customization string entered by the user.

    Methods that should be overridden in sub classes:
    • initialize() (page 230)
    • customization_help() (page 231)

    Useful methods:
    • temporary_file() (page 231)
    • __enter__()
    • load_resources() (page 231)

    supported_platforms = []
        List of platforms this plugin works on. For example: ['windows', 'osx', 'linux']

    name = 'Trivial Plugin'
        The name of this plugin. You must set it something other than Trivial Plugin for it to work.

    version = (1, 0, 0)
        The version of this plugin as a 3-tuple (major, minor, revision)

    description = u'Does absolutely nothing'
        A short string describing what this plugin does

    author = u'Unknown'
        The author of this plugin

    priority = 1
        When more than one plugin exists for a filetype, the plugins are run in order of decreasing priority. Plugins with higher priority will be run first. The highest possible priority is sys.maxint. Default priority is 1.

    minimum_calibre_version = (0, 4, 118)
        The earliest version of calibre this plugin requires

    can_be_disabled = True
        If False, the user will not be able to disable this plugin. Use with care.

    type = u'Base'
        The type of this plugin. Used for categorizing plugins in the GUI

    initialize()
        Called once when calibre plugins are initialized. Plugins are re-initialized every time a new plugin is
```

230 Chapter 11. Customizing calibre
added. Also note that if the plugin is run in a worker process, such as for adding books, then the plugin
will be initialized for every new worker process.

Perform any plugin specific initialization here, such as extracting resources from the plugin ZIP file. The
path to the ZIP file is available as self.plugin_path.

Note that self.site_customization is not available at this point.

cfg_widget()
Implement this method and save_settings() (page 231) in your plugin to use a custom configuration
dialog, rather then relying on the simple string based default customization.

This method, if implemented, must return a QWidget. The widget can have an optional method validate()
that takes no arguments and is called immediately after the user clicks OK. Changes are applied if and only
if the method returns True.

If for some reason you cannot perform the configuration at this time, return a tuple of two strings (message,
details), these will be displayed as a warning dialog to the user and the process will be aborted.

save_settings(config_widget)
Save the settings specified by the user with config_widget.

Parameters config_widget – The widget returned by config_widget() (page 231).

do_user_config(parent=None)
This method shows a configuration dialog for this plugin. It returns True if the user clicks OK, False
otherwise. The changes are automatically applied.

load_resources(names)
If this plugin comes in a ZIP file (user added plugin), this method will allow you to load resources from
the ZIP file.

For example to load an image:

```python
pixmap = QPixmap()
pixmap.loadFromData(self.load_resources(['images/icon.png']).itervalues().next())
icon = QIcon(pixmap)
```

Parameters names – List of paths to resources in the ZIP file using / as separator

Returns A dictionary of the form {name: file_contents}. Any names that were not
found in the ZIP file will not be present in the dictionary.

customization_help(gui=False)
Return a string giving help on how to customize this plugin. By default raise a
NotImplementedError, which indicates that the plugin does not require customization.

If you re-implement this method in your subclass, the user will be asked to enter a string as customization
for this plugin. The customization string will be available as self.site_customization.

Site customization could be anything, for example, the path to a needed binary on the user’s computer.

Parameters gui – If True return HTML help, otherwise return plain text help.

temporary_file(suffix)
Return a file-like object that is a temporary file on the file system. This file will remain available even after
being closed and will only be removed on interpreter shutdown. Use the name member of the returned
object to access the full path to the created temporary file.

Parameters suffix – The suffix that the temporary file will have.
`cli_main(args)`
This method is the main entry point for your plugins command line interface. It is called when the user does: `calibre-debug -r "Plugin Name"`. Any arguments passed are present in the `args` variable.

### 11.1.2 FileTypePlugin

```python
class calibre.customize.FileTypePlugin(plugin_path)
Bases: calibre.customize.Plugin (page 230)
```

A plugin that is associated with a particular set of file types.

```python
file_types = set([])
```

Set of file types for which this plugin should be run. Use `'*'` for all file types. For example: `{ 'lit', 'mobi', 'prc' }`

```python
on_import = False
```

If True, this plugin is run when books are added to the database

```python
on_postimport = False
```

If True, this plugin is run after books are added to the database. In this case the postimport and postadd methods of the plugin are called.

```python
on_preprocess = False
```

If True, this plugin is run just before a conversion

```python
on_postprocess = False
```

If True, this plugin is run after conversion on the final file produced by the conversion output plugin.

```python
run(path_to_ebook)
```
Run the plugin. Must be implemented in subclasses. It should perform whatever modifications are required on the e-book and return the absolute path to the modified e-book. If no modifications are needed, it should return the path to the original e-book. If an error is encountered it should raise an Exception. The default implementation simply return the path to the original e-book. Note that the path to the original file (before any file type plugins are run, is available as `self.original_path_to_file`).

The modified e-book file should be created with the `temporary_file()` method.

**Parameters**
- `path_to_ebook` – Absolute path to the e-book.

**Returns**
- Absolute path to the modified e-book.

```python
postimport(book_id, book_format, db)
```
Called post import, i.e., after the book file has been added to the database. Note that this is different from `postadd()` (page 232) which is called when the book record is created for the first time. This method is called whenever a new file is added to a book record. It is useful for modifying the book record based on the contents of the newly added file.

**Parameters**
- `book_format` – The file type of the book that was added.
- `db` – Library database.

```python
postadd(book_id, fmt_map, db)
```
Called post add, i.e. after a book has been added to the db. Note that this is different from `postimport()` (page 232), which is called after a single book file has been added to a book. `postadd()` is called only when an entire book record with possibly more than one book file has been created for the first time. This is useful if you wish to modify the book record in the database when the book is first added to calibre.

**Parameters**
• **book_id** – Database id of the added book.

• **fmt_map** – Map of file format to path from which the file format was added. Note that this might or might not point to an actual existing file, as sometimes files are added as streams. In which case it might be a dummy value or a non-existent path.

• **db** – Library database

### 11.1.3 Metadata plugins

```python
class calibre.customize.MetadataReaderPlugin(*args, **kwargs):
    Bases: calibre.customize.Plugin (page 230)

    A plugin that implements reading metadata from a set of file types.

    file_types = set([])
    # Set of file types for which this plugin should be run. For example: set(['lit', 'mobi', 'prc'])

    get_metadata(stream, type)
    # Return metadata for the file represented by stream (a file like object that supports reading). Raise an exception when there is an error with the input data.

    Parameters
    type -- The type of file. Guaranteed to be one of the entries in file_types (page 233).

    Returns
    A calibre.ebooks.metadata.book.Metadata object
```

```python
class calibre.customize.MetadataWriterPlugin(*args, **kwargs):
    Bases: calibre.customize.Plugin (page 230)

    A plugin that implements reading metadata from a set of file types.

    file_types = set([])
    # Set of file types for which this plugin should be run. For example: set(['lit', 'mobi', 'prc'])

    set_metadata(stream, mi, type)
    # Set metadata for the file represented by stream (a file like object that supports reading). Raise an exception when there is an error with the input data.

    Parameters

    • type -- The type of file. Guaranteed to be one of the entries in file_types (page 233).

    • mi -- A calibre.ebooks.metadata.book.Metadata object
```

### 11.1.4 Catalog plugins

```python
class calibre.customize.CatalogPlugin(plugin_path):
    Bases: calibre.customize.Plugin (page 230)

    A plugin that implements a catalog generator.

    file_types = set([])
    # Output file type for which this plugin should be run. For example: ‘epub’ or ‘xml’

    cli_options = []
    # CLI parser options specific to this plugin, declared as namedtuple Option:
```

11.1. API documentation for plugins 233
from collections import namedtuple

Option = namedtuple('Option', 'option, default, dest, help')

cli_options = [Option('--catalog-title', default = 'My Catalog', dest = 'catalog_title', help = _('Title of generated catalog. Default:') + ' "' + '%default' + '"')] cli_options parsed in calibre.db.cli.cmd_catalog:option_parser()

initialize()

If plugin is not a built-in, copy the plugin’s .ui and .py files from the ZIP file to $TMPDIR. Tab will be dynamically generated and added to the Catalog Options dialog in calibre.gui2.dialogs.catalog.py:Catalog

run(path_to_output, opts, db, ids, notification=None)

Run the plugin. Must be implemented in subclasses. It should generate the catalog in the format specified in file_types, returning the absolute path to the generated catalog file. If an error is encountered it should raise an Exception.

The generated catalog file should be created with the temporary_file() method.

Parameters

• path_to_output – Absolute path to the generated catalog file.
• opts – A dictionary of keyword arguments
• db – A LibraryDatabase2 object

11.1.5 Metadata download plugins

class calibre.ebooks.metadata.sources.base.Source(*args, **kwargs)
Bases: calibre.customize.Plugin (page 230)

capabilities = frozenset({})

Set of capabilities supported by this plugin. Useful capabilities are: ‘identify’, ‘cover’

touched_fields = frozenset({})

List of metadata fields that can potentially be download by this plugin during the identify phase

has_html_comments = False

Set this to True if your plugin returns HTML formatted comments

supports_gzip_transfer_encoding = False

Setting this to True means that the browser object will indicate that it supports gzip transfer encoding. This can speedup downloads but make sure that the source actually supports gzip transfer encoding correctly first

ignore_ssl_errors = False

Set this to True to ignore HTTPS certificate errors when connecting to this source.

cached_cover_url_is_reliable = True

Cached cover URLs can sometimes be unreliable (i.e. the download could fail or the returned image could be bogus. If that is often the case with this source set to False

options = ()

A list of Option objects. They will be used to automatically construct the configuration widget for this plugin

config_help_message = None

A string that is displayed at the top of the config widget for this plugin

can_get_multiple_covers = False

If True this source can return multiple covers for a given query

auto_trim_covers = False

If set to True covers downloaded by this plugin are automatically trimmed.
prefer_results_with_isbn = True
If set to True, and this source returns multiple results for a query, some of which have ISBNs and some of
which do not, the results without ISBNs will be ignored

is_configured()
Return False if your plugin needs to be configured before it can be used. For example, it might need a
username/password/API key.

customization_help()
Return a string giving help on how to customize this plugin. By default raise a
NotImplementedError, which indicates that the plugin does not require customization.

If you re-implement this method in your subclass, the user will be asked to enter a string as customization
for this plugin. The customization string will be available as self.site_customization.

Site customization could be anything, for example, the path to a needed binary on the user’s computer.

Parameters
gui – If True return HTML help, otherwise return plain text help.

config_widget()
Implement this method and save_settings() (page 235) in your plugin to use a custom configuration
dialog, rather then relying on the simple string based default customization.

This method, if implemented, must return a QWidget. The widget can have an optional method validate() that
takes no arguments and is called immediately after the user clicks OK. Changes are applied if and only
if the method returns True.

If for some reason you cannot perform the configuration at this time, return a tuple of two strings (message,
details), these will be displayed as a warning dialog to the user and the process will be aborted.

save_settings(config_widget)
Save the settings specified by the user with config_widget.

Parameters
cfg_config_widget – The widget returned by config_widget() (page 235).

get_author_tokens(authors, only_first_author=True)
Take a list of authors and return a list of tokens useful for an AND search query. This function tries to
return tokens in first name middle names last name order, by assuming that if a comma is in the author
name, the name is in lastname, other names form.

get_title_tokens(title, strip_joiners=True, strip_subtitle=False)
Take a title and return a list of tokens useful for an AND search query. Excludes connectives(optionally)
and punctuation.

split_jobs(jobs, num)
Split a list of jobs into at most num groups, as evenly as possible

test_fields(mi)
Return the first field from self.touched_fields that is null on the mi object

clean_downloaded_metadata(mi)
Call this method in your plugin’s identify method to normalize metadata before putting the Metadata object
into result_queue. You can of course, use a custom algorithm suited to your metadata source.

get_book_url(identifiers)
Return a 3-tuple or None. The 3-tuple is of the form: (identifier_type, identifier_value, URL). The URL
is the URL for the book identified by identifiers at this source. identifier_type, identifier_value specify the
identifier corresponding to the URL. This URL must be browseable to by a human using a browser. It is
meant to provide a clickable link for the user to easily visit the books page at this source. If no URL is
found, return None. This method must be quick, and consistent, so only implement it if it is possible to
construct the URL from a known scheme given identifiers.
**get_book_url_name** *(idtype, idval, url)*

Return a human readable name from the return value of get_book_url().

**get_book_urls** *(identifiers)*

Override this method if you would like to return multiple urls for this book. Return a list of 3-tuples. By default this method simply calls `get_book_url()` (page 235).

**get_cached_cover_url** *(identifiers)*

Return cached cover URL for the book identified by the identifiers dict or None if no such URL exists.

Note that this method must only return validated URLs, i.e. not URLs that could result in a generic cover image or a not found error.

**identify_results_keygen** *(title=None, authors=None, identifiers={})*

Return a function that is used to generate a key that can sort Metadata objects by their relevance given a search query (title, authors, identifiers).

These keys are used to sort the results of a call to `identify()` (page 236).

For details on the default algorithm see `InternalMetadataCompareKeyGen` (page 237). Re-implement this function in your plugin if the default algorithm is not suitable.

**identify** *(log, result_queue, abort, title=None, authors=None, identifiers={}, timeout=30)*

Identify a book by its title/author/isbn/etc.

If identifiers(s) are specified and no match is found and this metadata source does not store all related identifiers (for example, all ISBNs of a book), this method should retry with just the title and author (assuming they were specified).

If this metadata source also provides covers, the URL to the cover should be cached so that a subsequent call to the get covers API with the same ISBN/special identifier does not need to get the cover URL again. Use the caching API for this.

Every Metadata object put into result_queue by this method must have a `source_relevance` attribute that is an integer indicating the order in which the results were returned by the metadata source for this query. This integer will be used by `compare_identify_results()`. If the order is unimportant, set it to zero for every result.

Make sure that any cover/isbn mapping information is cached before the Metadata object is put into result_queue.

**Parameters**

- **log** – A log object, use it to output debugging information/errors
- **result_queue** – A result Queue, results should be put into it. Each result is a Metadata object
- **abort** – If abort.is_set() returns True, abort further processing and return as soon as possible
- **title** – The title of the book, can be None
- **authors** – A list of authors of the book, can be None
- **identifiers** – A dictionary of other identifiers, most commonly `{‘isbn’:‘1234...’}`
- **timeout** – Timeout in seconds, no network request should hang for longer than timeout.

**Returns** None if no errors occurred, otherwise a unicode representation of the error suitable for showing to the user.
download_cover(log, result_queue, abort, title=None, authors=None, identifiers={}, timeout=30, get_best_cover=False)

Download a cover and put it into result_queue. The parameters all have the same meaning as for identify() (page 236). Put (self, cover_data) into result_queue.

This method should use cached cover URLs for efficiency whenever possible. When cached data is not present, most plugins simply call identify and use its results.

If the parameter get_best_cover is True and this plugin can get multiple covers, it should only get the “best” one.

class calibre.ebooks.metadata.sources.base.InternalMetadataCompareKeyGen(mi, source_plugin, title, authors, identifiers)

Generate a sort key for comparison of the relevance of Metadata objects, given a search query. This is used only to compare results from the same metadata source, not across different sources.

The sort key ensures that an ascending order sort is a sort by order of decreasing relevance.

The algorithm is:

• Prefer results that have at least one identifier the same as for the query
• Prefer results with a cached cover URL
• Prefer results with all available fields filled in
• Prefer results with the same language as the current user interface language
• Prefer results that are an exact title match to the query
• Prefer results with longer comments (greater than 10% longer)
• Use the relevance of the result as reported by the metadata source’s search engine

11.1.6 Conversion plugins

class calibre.customize.conversion.InputFormatPlugin(*args)
Bases: calibre.customize.Plugin (page 230)

InputFormatPlugins are responsible for converting a document into HTML+OPF+CSS+etc. The results of the conversion must be encoded in UTF-8. The main action happens in convert() (page 238).

file_types = set([])
Set of file types for which this plugin should be run For example: set(['azw', 'mobi', 'prc'])

is_image_collection = False
If True, this input plugin generates a collection of images, one per HTML file. This can be set dynamically, in the convert method if the input files can be both image collections and non-image collections. If you set this to True, you must implement the get_images() method that returns a list of images.

core_usage = 1
Number of CPU cores used by this plugin. A value of -1 means that it uses all available cores

for_viewer = False
If set to True, the input plugin will perform special processing to make its output suitable for viewing
output_encoding = 'utf-8'
    The encoding that this input plugin creates files in. A value of None means that the encoding is undefined and must be detected individually

common_options = set([<calibre.customize.conversion.OptionRecommendation object>])
    Options shared by all Input format plugins. Do not override in sub-classes. Use options (page 238) instead. Every option must be an instance of OptionRecommendation.

options = set([])
    Options to customize the behavior of this plugin. Every option must be an instance of OptionRecommendation.

recommendations = set([])
    A set of 3-tuples of the form (option_name, recommended_value, recommendation_level)

get_images()
    Return a list of absolute paths to the images, if this input plugin represents an image collection. The list of images is in the same order as the spine and the TOC.

convert(stream, options, file_ext, log, accelerators)
    This method must be implemented in sub-classes. It must return the path to the created OPF file or an OEBBook instance. All output should be contained in the current directory. If this plugin creates files outside the current directory they must be deleted/marked for deletion before this method returns.

    Parameters
    • stream – A file like object that contains the input file.
    • options – Options to customize the conversion process. Guaranteed to have attributes corresponding to all the options declared by this plugin. In addition, it will have a verbose attribute that takes integral values from zero upwards. Higher numbers mean be more verbose. Another useful attribute is input_profile that is an instance of calibre.customize.profiles.InputProfile.
    • file_ext – The extension (without the .) of the input file. It is guaranteed to be one of the file_types supported by this plugin.
    • log – A calibre.utils.logging.Log object. All output should use this object.
    • accelerators – A dictionary of various information that the input plugin can get easily that would speed up the subsequent stages of the conversion.

postprocess_book(oeb, opts, log)
    Called to allow the input plugin to perform postprocessing after the book has been parsed.

specialize(oeb, opts, log, output_fmt)
    Called to allow the input plugin to specialize the parsed book for a particular output format. Called after postprocess_book and before any transforms are performed on the parsed book.

gui_configuration_widget(parent, get_option_by_name, get_option_help, db, book_id=None)
    Called to create the widget used for configuring this plugin in the calibre GUI. The widget must be an instance of the PluginWidget class. See the builtin input plugins for examples.

class calibre.customize.conversion.OutputFormatPlugin(*args)
    Bases: calibre.customize.Plugin (page 230)

OutputFormatPlugins are responsible for converting an OEB document (OPF+HTML) into an output e-book.

The OEB document can be assumed to be encoded in UTF-8. The main action happens in convert() (page 239).

file_type = None
    The file type (extension without leading period) that this plugin outputs
common_options = set([<calibre.customize.conversion.OptionRecommendation object>])
Options shared by all Input format plugins. Do not override in sub-classes. Use options (page 239) instead. Every option must be an instance of OptionRecommendation.

options = set([])
Options to customize the behavior of this plugin. Every option must be an instance of OptionRecommendation.

recommendations = set([])
A set of 3-tuples of the form (option_name, recommended_value, recommendation_level)

convert(oeb_book, output, input_plugin, opts, log)
Render the contents of oeb_book (which is an instance of calibre.ebooks.oeb.OEBBook) to the file specified by output.

Parameters
• output – Either a file like object or a string. If it is a string it is the path to a directory that may or may not exist. The output plugin should write its output into that directory. If it is a file like object, the output plugin should write its output into the file.
• input_plugin – The input plugin that was used at the beginning of the conversion pipeline.
• opts – Conversion options. Guaranteed to have attributes corresponding to the OptionRecommendations of this plugin.
• log – The logger. Print debug/info messages etc. using this.

specialize_options (log, opts, input_fmt)
Can be used to change the values of conversion options, as used by the conversion pipeline.

specialize_css_for_output (log, opts, item, stylizer)
Can be used to make changes to the css during the CSS flattening process.

Parameters
• item – The item (HTML file) being processed
• stylizer – A Stylizer object containing the flattened styles for item. You can get the style for any element by stylizer.style(element).

gui_configuration_widget (parent, get_option_by_name, get_option_help, db, book_id=’None’)
Called to create the widget used for configuring this plugin in the calibre GUI. The widget must be an instance of the PluginWidget class. See the builtin output plugins for examples.

11.1.7 Device drivers

The base class for all device drivers is DevicePlugin (page 239). However, if your device exposes itself as a USBMS drive to the operating system, you should use the USBMS class instead as it implements all the logic needed to support these kinds of devices.

class calibre.devices.interface.DevicePlugin (plugin_path)
Bases: calibre.customize.Plugin (page 230)

Defines the interface that should be implemented by backends that communicate with an e-book reader.

FORMATS = ['lrf', 'rtf', 'pdf', 'txt']
Ordered list of supported formats
VENDOR_ID = 0
VENDOR_ID can be either an integer, a list of integers or a dictionary. If it is a dictionary, it must be a
dictionary of dictionaries, of the form:

```python
{
    integer_vendor_id : { product_id : [list of BCDs], ... },
    ...
}
```

PRODUCT_ID = 0
An integer or a list of integers

BCD = None
BCD can be either None to not distinguish between devices based on BCD, or it can be a list of the BCD
numbers of all devices supported by this driver.

THUMBNAIL_HEIGHT = 68
Height for thumbnails on the device

THUMBNAIL_COMPRESSION_QUALITY = 75
Compression quality for thumbnails. Set this closer to 100 to have better quality thumbnails with fewer
compression artifacts. Of course, the thumbnails get larger as well.

WANTS_UPDATED_THUMBNNAILS = False
Set this to True if the device supports updating cover thumbnails during sync_booklists. Setting it to true
will ask device.py to refresh the cover thumbnails during book matching.

CAN_SET_METADATA = ['title', 'authors', 'collections']
Whether the metadata on books can be set via the GUI.

CAN_DO_DEVICE_DB_PLUGINBOARD = False
Whether the device can handle device_db metadata plugboards.

path_sep = '/'
Path separator for paths to books on device

icon = '/home/kovid/work/calibre/resources/images/reader.png'
Icon for this device

UserAnnotation
alias of Annotation

OPEN_FEEDBACK_MESSAGE = None
GUI displays this as a message if not None. Useful if opening can take a long time.

VIRTUAL_BOOK_EXTENSIONS = frozenset([])
Set of extensions that are “virtual books” on the device and therefore cannot be viewed/saved-added to
library. For example: frozenset(['kobo'])

VIRTUAL_BOOK_EXTENSION_MESSAGE = None
Message to display to user for virtual book extensions.

NUKE_COMMENTS = None
Whether to nuke comments in the copy of the book sent to the device. If not None this should be short
string that the comments will be replaced by.

MANAGES_DEVICE_PRESENCE = False
If True indicates that this driver completely manages device detection, ejecting and so forth. If you set this
to True, you must implement the detect_managed_devices and debug_managed_device_detection meth-
ods. A driver with this set to true is responsible for detection of devices, managing a blacklist of devices,
a list of ejected devices and so forth. calibre will periodically call the detect_managed_devices() method.
and if it returns a detected device, calibre will call open(). open() will be called every time a device is
returned even if previous calls to open() failed, therefore the driver must maintain its own blacklist of
failed devices. Similarly, when ejecting, calibre will call eject() and then assuming the next call to de-
tect_managed_devices() returns None, it will call post_yank_cleanup().

SLOW_DRIVEINFO = False
If set the True, calibre will call the get_driveinfo() (page 242) method after the books lists have
been loaded to get the driveinfo.

ASK_TO.Allow.CONNECT = False
If set to True, calibre will ask the user if they want to manage the device with calibre, the first
time it is detected. If you set this to True you must implement get_device_uid() (page 245)
and ignore_connected_device() (page 245) and get_user_blacklisted_devices() (page 245) and
set_user_blacklisted_devices() (page 245)

user_feedback_after_callback = None
Set this to a dictionary of the form {'title':title, 'msg':msg, ‘det_msg’:detailed_msg} to have calibre popup
a message to the user after some callbacks are run (currently only upload_books). Be careful to not spam
the user with too many messages. This variable is checked after every callback, so only set it when you
really need to.

is_usb_connected (devices_on_system, debug=False, only_presence=False)
Return True, device_info if a device handled by this plugin is currently connected.

Parameters

- devices_on_system – List of devices currently connected

detect_managed_devices (devices_on_system, force_refresh=False)
Called only if MANAGES_DEVICE_PRESENCE is True.

Scan for devices that this driver can handle. Should return a device object if a device is found. This object
will be passed to the open() method as the connected_device. If no device is found, return None. The
returned object can be anything, calibre does not use it, it is only passed to open().

This method is called periodically by the GUI, so make sure it is not too resource intensive. Use a cache
to avoid repeatedly scanning the system.

Parameters

- devices_on_system – Set of USB devices found on the system.
- force_refresh – If True and the driver uses a cache to prevent repeated scanning, the
  cache must be flushed.

debug_managed_device_detection (devices_on_system, output)
Called only if MANAGES_DEVICE_PRESENCE is True.

Should write information about the devices detected on the system to output, which is a file like object.
Should return True if a device was detected and successfully opened, otherwise False.

reset (key='1', log_packets=False, report_progress=None, detected_device=None)

Parameters

- key – The key to unlock the device
- log_packets – If true the packet stream to/from the device is logged
- report_progress – Function that is called with a % progress (number between 0 and
  100) for various tasks If it is called with -1 that means that the task does not have any
  progress information
- detected_device – Device information from the device scanner
can_handle_windows(usbdevice, debug=False)
Optional method to perform further checks on a device to see if this driver is capable of handling it. If it is not it should return False. This method is only called after the vendor, product ids and the bcd have matched, so it can do some relatively time intensive checks. The default implementation returns True. This method is called only on Windows. See also can_handle() (page 242).

Note that for devices based on USBMS this method by default delegates to can_handle() (page 242). So you only need to override can_handle() (page 242) in your subclass of USBMS.

Parameters

- **usbdevice** – A usbdevice as returned by calibre.devices.winusb.scan_usb_devices()

can_handle(device_info, debug=False)
Unix version of can_handle_windows() (page 241).

Parameters

- **device_info** – Is a tuple of (vid, pid, bcd, manufacturer, product, serial number)

open(connected_device, library_uuid)
Perform any device specific initialization. Called after the device is detected but before any other functions that communicate with the device. For example: For devices that present themselves as USB Mass storage devices, this method would be responsible for mounting the device or if the device has been automounted, for finding out where it has been mounted. The method calibre.devices.usbms.device.Device.open() (page 249) has an implementation of this function that should serve as a good example for USB Mass storage devices.

This method can raise an OpenFeedback exception to display a message to the user.

Parameters

- **connected_device** – The device that we are trying to open. It is a tuple of (vendor id, product id, bcd, manufacturer name, product name, device serial number). However, some devices have no serial number and on windows only the first three fields are present, the rest are None.

- **library_uuid** – The UUID of the current calibre library. Can be None if there is no library (for example when used from the command line).

eject()
Un-mount / eject the device from the OS. This does not check if there are pending GUI jobs that need to communicate with the device.

NOTE: That this method may not be called on the same thread as the rest of the device methods.

post_yank_cleanup()
Called if the user yanks the device without ejecting it first.

set_progress_reporter(report_progress)
Set a function to report progress information.

Parameters

- **report_progress** – Function that is called with a % progress (number between 0 and 100) for various tasks If it is called with -1 that means that the task does not have any progress information

get_device_information(end_session=True)
Ask device for device information. See L{DeviceInfoQuery}.

Returns (device name, device version, software version on device, mime type) The tuple can optionally have a fifth element, which is a drive information dictionary. See usbms.driver for an example.

get_driveinfo()
Return the driveinfo dictionary. Usually called from get_device_information(), but if loading the driveinfo
is slow for this driver, then it should set SLOW_DRIVEINFO. In this case, this method will be called by calibre after the book lists have been loaded. Note that it is not called on the device thread, so the driver should cache the drive info in the books() method and this function should return the cached data.

**card_prefix**(end_session=True)

Return a 2 element list of the prefix to paths on the cards. If no card is present None is set for the card's prefix. E.G. (’/place’, ’/place2’) (None, ‘place2’) (’place’, None) (None, None)

**total_space**(end_session=True)

Get total space available on the mountpoints:
1. Main memory
2. Memory Card A
3. Memory Card B

**Returns** A 3 element list with total space in bytes of (1, 2, 3). If a particular device doesn’t have any of these locations it should return 0.

**free_space**(end_session=True)

Get free space available on the mountpoints:
1. Main memory
2. Card A
3. Card B

**Returns** A 3 element list with free space in bytes of (1, 2, 3). If a particular device doesn’t have any of these locations it should return -1.

**books**(oncard=None, end_session=True)

Return a list of e-books on the device.

**Parameters**

- **oncard** – If ‘carda’ or ‘cardb’ return a list of e-books on the specific storage card, otherwise return list of e-books in main memory of device. If a card is specified and no books are on the card return empty list.

**Returns** A BookList.

**upload_books**(files, names, on_card=None, end_session=True, metadata=None)

Upload a list of books to the device. If a file already exists on the device, it should be replaced. This method should raise a FreeSpaceError if there is not enough free space on the device. The text of the FreeSpaceError must contain the word “card” if on_card is not None otherwise it must contain the word “memory”.

**Parameters**

- **files** – A list of paths
- **names** – A list of file names that the books should have once uploaded to the device. len(names) == len(files)
- **metadata** – If not None, it is a list of Metadata objects. The idea is to use the metadata to determine where on the device to put the book. len(metadata) == len(files). Apart from the regular cover (path to cover), there may also be a thumbnail attribute, which should be used in preference. The thumbnail attribute is of the form (width, height, cover_data as jpeg).
Returns A list of 3-element tuples. The list is meant to be passed to
\texttt{add_books_to_metadata()} (page 244).

class\textbf{method} \textbf{add_books_to_metadata} (\texttt{locations, metadata, booklists})

Add locations to the booklists. This function must not communicate with the device.

Parameters

• \textbf{locations} – Result of a call to L{upload_books}

• \textbf{metadata} – List of \texttt{Metadata} objects, same as for \texttt{upload_books()} (page 243).

• \textbf{booklists} – A tuple containing the result of calls to (\texttt{books(oncard=None)()},
books(oncard='carda')(), :meth'books(oncard='cardb')').

d\textbf{elete\_books} (\texttt{paths, end\_session=True})

Delete books at paths on device.

class\textbf{method} \textbf{remove\_books\_from\_metadata} (\texttt{paths, booklists})

Remove books from the metadata list. This function must not communicate with the device.

Parameters

• \textbf{paths} – paths to books on the device.

• \textbf{booklists} – A tuple containing the result of calls to (\texttt{books(oncard=None)()},
books(oncard='carda')(), :meth'books(oncard='cardb')').

\textbf{sync\_booklists} (\texttt{booklists, end\_session=True})

Update metadata on device.

Parameters \textbf{booklists} – A tuple containing the result of calls
to (\texttt{books(oncard=None)()},
books(oncard='carda')(), :meth'books(oncard='cardb')').

d\textbf{get\_file} (\texttt{path, outfile, end\_session=True})

Read the file at \texttt{path} on the device and write it to \texttt{outfile}.

Parameters \textbf{outfile} – file object like \texttt{sys.stdout} or the result of an \texttt{open()} (page 242) call.

class\textbf{method} \textbf{config\_widget} ()

Should return a \texttt{QWidget}. The \texttt{QWidget} contains the settings for the device interface.

\textbf{class}\textbf{method} \textbf{save\_settings} (\texttt{settings\_widget})

Should save settings to disk. Takes the widget created in \texttt{config\_widget()} (page 244) and saves all
current settings to disk.

\textbf{class}\textbf{method} \textbf{settings} ()

Should return an \texttt{opts} object. The \texttt{opts} object should have at least one attribute \texttt{format\_map} which is an
ordered list of formats for the device.

\textbf{set\_plugboards} (\texttt{plugboards, pb\_func})

Provide the driver the current set of plugboards and a function to select a specific plugboard. This method
is called immediately before \texttt{add\_books} and \texttt{sync\_booklists}.

\textbf{pb\_func is a callable with the following signature:}:
\begin{verbatim}
def pb_func(device_name, format, plugboards)
\end{verbatim}

You give it the current device name (either the class name or \texttt{DEVICE\_PLUGBOARD\_NAME}), the format
you are interested in (a 'real' format or 'device\_db'), and the plugboards (you were given those by
\texttt{set\_plugboards}, the same place you got this method).

Returns None or a single plugboard instance.
**set_driveinfo_name** *(location_code, name)*
Set the device name in the driveinfo file to ‘name’. This setting will persist until the file is re-created or the name is changed again.

Non-disk devices should implement this method based on the location codes returned by the get_device_information() method.

**prepare_addable_books** *(paths)*
Given a list of paths, returns another list of paths. These paths point to addable versions of the books.

If there is an error preparing a book, then instead of a path, the position in the returned list for that book should be a three tuple: (original_path, the exception instance, traceback)

**startup** *
Called when calibre is starting the device. Do any initialization required. Note that multiple instances of the class can be instantiated, and thus __init__ can be called multiple times, but only one instance will have this method called. This method is called on the device thread, not the GUI thread.

**shutdown** *
Called when calibre is shutting down, either for good or in preparation to restart. Do any cleanup required. This method is called on the device thread, not the GUI thread.

**get_device_uid** *
Must return a unique id for the currently connected device (this is called immediately after a successful call to open()). You must implement this method if you set ASK_TO_ALLOW_CONNECT = True

**ignore_connected_device** *(uid)*
Should ignore the device identified by uid (the result of a call to get_device_uid()) in the future. You must implement this method if you set ASK_TO_ALLOW_CONNECT = True. Note that this function is called immediately after open(), so if open() caches some state, the driver should reset that state.

**get_user_blacklisted_devices** *
Return map of device uid to friendly name for all devices that the user has asked to be ignored.

**set_user_blacklisted_devices** *(devices)*
Set the list of device uids that should be ignored by this driver.

**specialize_global_preferences** *(deviceprefs)*
Implement this method if your device wants to override a particular preference. You must ensure that all call sites that want a preference that can be overridden use device_prefs[‘something’] instead of prefs[‘something’]. Your method should call device_prefs.set_overrides(pref=val, pref=val, …). Currently used for: metadata management (prefs[‘manage_device_metadata’])

**set_library_info** *(library_name, library_uuid, field_metadata)*
Implement this method if you want information about the current calibre library. This method is called at startup and when the calibre library changes while connected.

**is_dynamically_controllable** *
Called by the device manager when starting plugins. If this method returns a string, then a) it supports the device manager’s dynamic control interface, and b) that name is to be used when talking to the plugin.

This method can be called on the GUI thread. A driver that implements this method must be thread safe.

**start_plugin** *
This method is called to start the plugin. The plugin should begin to accept device connections however it does that. If the plugin is already accepting connections, then do nothing.

This method can be called on the GUI thread. A driver that implements this method must be thread safe.

**stop_plugin** *
This method is called to stop the plugin. The plugin should no longer accept connections, and should
cleanup behind itself. It is likely that this method should call shutdown. If the plugin is already not accepting connections, then do nothing.

This method can be called on the GUI thread. A driver that implements this method must be thread safe.

**get_option**(opt_string, default=None)

Return the value of the option indicated by opt_string. This method can be called when the plugin is not started. Return None if the option does not exist.

This method can be called on the GUI thread. A driver that implements this method must be thread safe.

**set_option**(opt_string, opt_value)

Set the value of the option indicated by opt_string. This method can be called when the plugin is not started.

This method can be called on the GUI thread. A driver that implements this method must be thread safe.

**is_running**()

Return True if the plugin is started, otherwise False

This method can be called on the GUI thread. A driver that implements this method must be thread safe.

**synchronize_with_db**(db, book_id, book_metadata, first_call)

Called during book matching when a book on the device is matched with a book in calibre’s db. The method is responsible for synchronizing data from the device to calibre’s db (if needed).

The method must return a two-value tuple. The first value is a set of calibre book ids changed if calibre’s database was changed or None if the database was not changed. If the first value is an empty set then the metadata for the book on the device is updated with calibre’s metadata and given back to the device, but no GUI refresh of that book is done. This is useful when the calibre data is correct but must be sent to the device.

The second value is itself a 2-value tuple. The first value in the tuple specifies whether a book format should be sent to the device. The intent is to permit verifying that the book on the device is the same as the book in calibre. This value must be None if no book is to be sent, otherwise return the base file name on the device (a string like foobar.epub). Be sure to include the extension in the name. The device subsystem will construct a send_books job for all books with not-None returned values. Note: other than to later retrieve the extension, the name is ignored in cases where the device uses a template to generate the file name, which most do. The second value in the returned tuple indicated whether the format is future-dated. Return True if it is, otherwise return False. calibre will display a dialog to the user listing all future dated books.

Extremely important: this method is called on the GUI thread. It must be threadsafe with respect to the device manager’s thread.

book_id: the calibre id for the book in the database. book_metadata: the Metadata object for the book coming from the device. first_call: True if this is the first call during a sync, False otherwise

**class** calibre.devices.interface.BookList(oncard, prefix, settings)

**Bases:** list

A list of books. Each Book object must have the fields

1. title
2. authors
3. size (file size of the book)
4. datetime (a UTC time tuple)
5. path (path on the device to the book)
6. thumbnail (can be None) thumbnail is either a str/bytes object with the image data or it should have an attribute image_path that stores an absolute (platform native) path to the image

7. tags (a list of strings, can be empty).

supports_collections() 
Return True if the device supports collections for this book list.

add_book(book, replace_metadata)
Add the book to the booklist. Intent is to maintain any device-internal metadata. Return True if booklists must be sync’ed

remove_book(book)
Remove a book from the booklist. Correct any device metadata at the same time

get_collections(collection_attributes)
Return a dictionary of collections created from collection_attributes. Each entry in the dictionary is of the form collection name:[list of books]
The list of books is sorted by book title, except for collections created from series, in which case series_index is used.

Parameters collection_attributes – A list of attributes of the Book object

**USB Mass Storage based devices**

The base class for such devices is `calibre.devices.usbms.driver.USBMS` (page 250). This class in turn inherits some of its functionality from its bases, documented below. A typical basic USBMS based driver looks like this:

```python
from calibre.devices.usbms.driver import USBMS

class PDNOVEL(USBMS):
    name = 'Pandigital Novel device interface'
    gui_name = 'PD Novel'
    description = _('Communicate with the Pandigital Novel')
    author = 'Kovid Goyal'
    supported_platforms = ['windows', 'linux', 'osx']
    FORMATS = ['epub', 'pdf']

    VENDOR_ID = [0x18d1]
    PRODUCT_ID = [0xb004]
    BCD = [0x224]

    THUMBNAIL_HEIGHT = 144

    EBOOK_DIR_MAIN = 'eBooks'
    SUPPORTS_SUB_DIRS = False

    def upload_cover(self, path, filename, metadata):
        coverdata = getattr(metadata, 'thumbnail', None)
        if coverdata and coverdata[2]:
            with open('%s.jpg' % os.path.join(path, filename), 'wb') as coverfile:
                coverfile.write(coverdata[2])

class calibre.devices.usbms.device.Device(plugin_path)
```
This class provides logic common to all drivers for devices that export themselves as USB Mass Storage devices. Provides implementations for mounting/ejecting of USBMS devices on all platforms.

**WINDOWS_MAIN_MEM = None**
String identifying the main memory of the device in the windows PnP id strings. This can be None, string, list of strings or compiled regex.

**WINDOWS_CARD_A_MEM = None**
String identifying the first card of the device in the windows PnP id strings. This can be None, string, list of strings or compiled regex.

**WINDOWS_CARD_B_MEM = None**
String identifying the second card of the device in the windows PnP id strings. This can be None, string, list of strings or compiled regex.

**OSX_MAIN_MEM_VOL_PAT = None**
Used by the new driver detection to disambiguate main memory from storage cards. Should be a regular expression that matches the main memory mount point assigned by macOS.

**MAX_PATH_LEN = 250**
The maximum length of paths created on the device.

**NEWS_IN_FOLDER = True**
Put news in its own folder.

**reset** (*key=-1, log_packets=False, report_progress=None, detected_device=None*)

**Parameters**
- **key** – The key to unlock the device
- **log_packets** – If true the packet stream to/from the device is logged
- **report_progress** – Function that is called with a % progress (number between 0 and 100) for various tasks. If it is called with -1 that means that the task does not have any progress information.
- **detected_device** – Device information from the device scanner.

**set_progress_reporter** (*report_progress*)
Set a function to report progress information.

**Parameters**
- **report_progress** – Function that is called with a % progress (number between 0 and 100) for various tasks. If it is called with -1 that means that the task does not have any progress information.

**card_prefix** (*end_session=True*)
Return a 2 element list of the prefix to paths on the cards. If no card is present None is set for the card’s prefix. E.G. (`'/place'`, `'/place2'`) (None, `'/place2'`) (`'place'`, None) (None, None)

**total_space** (*end_session=True*)
Get total space available on the mountpoints:
1. Main memory
2. Memory Card A
3. Memory Card B

**Returns** A 3 element list with total space in bytes of (1, 2, 3). If a particular device doesn’t have any of these locations it should return 0.

**free_space** (*end_session=True*)
Get free space available on the mountpoints:

1. Main memory
2. Card A
3. Card B

**Returns** A 3 element list with free space in bytes of (1, 2, 3). If a particular device doesn’t have any of these locations it should return -1.

`windows_sort_drives(drives)`
Called to disambiguate main memory and storage card for devices that do not distinguish between them on the basis of `WINDOWS_CARD_NAME`. For e.g.: The EB600

`can_handle_windows(usbdevice, debug=False)`
Optional method to perform further checks on a device to see if this driver is capable of handling it. If it is not it should return False. This method is only called after the vendor, product ids and the bcd have matched, so it can do some relatively time intensive checks. The default implementation returns True. This method is called only on Windows. See also `can_handle()`.

Note that for devices based on USBMS this method by default delegates to `can_handle()`. So you only need to override `can_handle()` in your subclass of USBMS.

**Parameters**
- `usbdevice` – A usbdevice as returned by `calibre.devices.winusb.scan_usb_devices()`

`open(connected_device, library_uuid)`
Perform any device specific initialization. Called after the device is detected but before any other functions that communicate with the device. For example: For devices that present themselves as USB Mass storage devices, this method would be responsible for mounting the device or if the device has been automounted, for finding out where it has been mounted. The method `calibre.devices.usbms.device.Device.open()` (page 249) has an implementation of this function that should serve as a good example for USB Mass storage devices.

This method can raise an OpenFeedback exception to display a message to the user.

**Parameters**
- `connected_device` – The device that we are trying to open. It is a tuple of (vendor id, product id, bcd, manufacturer name, product name, device serial number). However, some devices have no serial number and on windows only the first three fields are present, the rest are None.
- `library_uuid` – The UUID of the current calibre library. Can be None if there is no library (for example when used from the command line).

`eject()`
Un-mount / eject the device from the OS. This does not check if there are pending GUI jobs that need to communicate with the device.

**NOTE:** That this method may not be called on the same thread as the rest of the device methods.

`post_yank_cleanup()`
Called if the user yanks the device without ejecting it first.

`sanitize_callback(path)`
Callback to allow individual device drivers to override the path sanitization used by `create_upload_path()`.

`filename_callback(default, mi)`
Callback to allow drivers to change the default file name set by `create_upload_path()`.
sanitize_path_components(components)
Perform any device specific sanitization on the path components for files to be uploaded to the device

get_annotations(path_map)
Resolve path_map to annotation_map of files found on the device

add_annotation_to_library(db, db_id, annotation)
Add an annotation to the calibre library

class calibre.devices.usbms.cli.CLI

class calibre.devices.usbms.driver.USBMS(plugin_path)
Bases: calibre.devices.usbms.cli.CLI (page 250), calibre.devices.usbms.device.Device (page 247)
The base class for all USBMS devices. Implements the logic for sending/getting/updating metadata/caching metadata/etc.

booklist_class
alias of calibre.devices.usbms.books.BookList

book_class
alias of calibre.devices.usbms.books.Book

get_device_information(end_session=True)
Ask device for device information. See L{DeviceInfoQuery}.

Returns (device name, device version, software version on device, mime type) The tuple can optionally have a fifth element, which is a drive information dictionary. See usbms.driver for an example.

set_driveinfo_name(location_code, name)
Set the device name in the driveinfo file to ‘name’. This setting will persist until the file is re-created or the name is changed again.

Non-disk devices should implement this method based on the location codes returned by the get_device_information() method.

books(oncard=None, end_session=True)
Return a list of e-books on the device.

Parameters
oncard – If ‘carda’ or ‘cardb’ return a list of e-books on the specific storage card, otherwise return list of e-books in main memory of device. If a card is specified and no books are on the card return empty list.

Returns A BookList.

upload_books(files, names, on_card=None, end_session=True, metadata=None)
Upload a list of books to the device. If a file already exists on the device, it should be replaced. This method should raise a FreeSpaceError if there is not enough free space on the device. The text of the FreeSpaceError must contain the word “card” if on_card is not None otherwise it must contain the word “memory”.

Parameters
• files – A list of paths
• names – A list of file names that the books should have once uploaded to the device. len(names) == len(files)
• metadata – If not None, it is a list of Metadata objects. The idea is to use the metadata to determine where on the device to put the book. len(metadata) == len(files). Apart from the regular cover (path to cover), there may also be a thumbnail attribute, which should be
Returns A list of 3-element tuples. The list is meant to be passed to add_books_to_metadata() (page 251).

upload_cover(path, filename, metadata, filepath)
Upload book cover to the device. Default implementation does nothing.

Parameters

- **path** – The full path to the directory where the associated book is located.
- **filename** – The name of the book file without the extension.
- **metadata** – metadata belonging to the book. Use metadata.thumbnail for cover
- **filepath** – The full path to the e-book file

add_books_to_metadata(locations, metadata, booklists)
Add locations to the booklists. This function must not communicate with the device.

Parameters

- **locations** – Result of a call to L{upload_books}
- **metadata** – List of Metadata objects, same as for upload_books() (page 250).
- **booklists** – A tuple containing the result of calls to (books(oncard=None)(), books(oncard='carda')(), :meth'books(oncard='cardb')').

delete_books(paths, end_session=True)
Delete books at paths on device.

remove_books_from_metadata(paths, booklists)
Remove books from the metadata list. This function must not communicate with the device.

Parameters

- **paths** – paths to books on the device.
- **booklists** – A tuple containing the result of calls to (books(oncard=None)(), books(oncard='carda')(), :meth'books(oncard='cardb')').

sync_booklists(booklists, end_session=True)
Update metadata on device.

Parameters booklists – A tuple containing the result of calls to (books(oncard=None)(), books(oncard='carda')(), :meth'books(oncard='cardb')').

classmethod normalize_path(path)
Return path with platform native path separators

11.1.8 User Interface Actions

If you are adding your own plugin in a ZIP file, you should subclass both InterfaceActionBase and InterfaceAction. The load_actual_plugin() method of your InterfaceActionBase subclass must return an instantiated object of your InterfaceBase subclass.

class calibre.gui2.actions.InterfaceAction(parent, site_customization)
Bases: PyQt5.QtCore.QObject
A plugin representing an “action” that can be taken in the graphical user interface. All the items in the toolbar and context menus are implemented by these plugins.

Note that this class is the base class for these plugins, however, to integrate the plugin with calibre’s plugin system, you have to make a wrapper class that references the actual plugin. See the `calibre.customize.builtins` module for examples.

If two `InterfaceAction` objects have the same name, the one with higher priority takes precedence.

Sub-classes should implement the `genesis()` (page 254), `library_changed()` (page 254), `location_selected()` (page 254) `shutting_down()` (page 254) and `initialization_complete()` (page 254) methods.

Once initialized, this plugin has access to the main calibre GUI via the `gui` member. You can access other plugins by name, for example:

```python
self.gui.iactions['Save To Disk']
```

To access the actual plugin, use the `interface_action_base_plugin` attribute, this attribute only becomes available after the plugin has been initialized. Useful if you want to use methods from the plugin class like `do_user_config()`.

The QAction specified by `action_spec` (page 252) is automatically create and made available as `self.qaction`.

```python
name = 'Implement me'
```

The plugin name. If two plugins with the same name are present, the one with higher priority takes precedence.

```python
priority = 1
```

The plugin priority. If two plugins with the same name are present, the one with higher priority takes precedence.

```python
popup_type = 1
```

The menu popup type for when this plugin is added to a toolbar

```python
auto_repeat = False
```

Whether this action should be auto repeated when its shortcut key is held down.

```python
action_spec = ('text', 'icon', None, None)
```

Of the form: (text, icon_path, tooltip, keyboard shortcut) icon, tooltip and keyboard shortcut can be None shortcut must be a string, None or tuple of shortcuts. If None, a keyboard shortcut corresponding to the action is not registered. If you pass an empty tuple, then the shortcut is registered with no default key binding.

```python
action_add_menu = False
```

If True, a menu is automatically created and added to `self.qaction`

```python
action_menu_clone_qaction = False
```

If True, a clone of `self.qaction` is added to the menu of `self.qaction` If you want the text of this action to be different from that of `self.qaction`, set this variable to the new text

```python
dont_add_to = frozenset([])
```

Set of locations to which this action must not be added. See `all_locations` for a list of possible locations

```python
dont_remove_from = frozenset([])
```

Set of locations from which this action must not be removed. See `all_locations` for a list of possible locations

---

252 Chapter 11. Customizing calibre
action_type = 'global'
Type of action ‘current’ means acts on the current view ‘global’ means an action that does not act on the
current view, but rather on calibre as a whole

accepts_drops = False
If True, then this InterfaceAction will have the opportunity to interact with drag and drop events. See the
methods, accept_enter_event () (page 253), :meth:`accept_drag_move_event`, drop_event ()
(page 253) for details.

accept_enter_event (event, mime_data)
This method should return True iff this interface action is capable of handling the drag event. Do not call
accept/ignore on the event, that will be taken care of by the calibre UI.

accept_drag_move_event (event, mime_data)
This method should return True iff this interface action is capable of handling the drag event. Do not call
accept/ignore on the event, that will be taken care of by the calibre UI.

drop_event (event, mime_data)
This method should perform some useful action and return True iff this interface action is capable of
handling the drop event. Do not call accept/ignore on the event, that will be taken care of by the cali-
bre UI. You should not perform blocking/long operations in this function. Instead emit a signal or use
QTimer.singleShot and return quickly. See the builtin actions for examples.

create_menu_action (menu, unique_name, text, icon=None, shortcut=None, description=None,
triggered=None, shortcut_name=None)
Convenience method to easily add actions to a QMenu. Returns the created QAction. This action has one
extra attribute calibre_shortcut_unique_name which if not None refers to the unique name under which
this action is registered with the keyboard manager.

Parameters

• menu – The QMenu the newly created action will be added to

• unique_name – A unique name for this action, this must be globally unique, so make it
  as descriptive as possible. If in doubt add a uuid to it.

• text – The text of the action.

• icon – Either a QIcon or a file name. The file name is passed to the I() builtin, so you do
  not need to pass the full path to the images directory.

• shortcut – A string, a list of strings, None or False. If False, no keyboard shortcut
  is registered for this action. If None, a keyboard shortcut with no default keybinding is
  registered. String and list of strings register a shortcut with default keybinding as specified.

• description – A description for this action. Used to set tooltips.

• triggered – A callable which is connected to the triggered signal of the created action.

• shortcut_name – The text displayed to the user when customizing the keyboard short-
cuts for this action. By default it is set to the value of text.

load_resources (names)
If this plugin comes in a ZIP file (user added plugin), this method will allow you to load resources from
the ZIP file.

For example to load an image:

```python
pixmap = QPixmap()
pixmap.loadFromData(self.load_resources(['images/icon.png']).itervalues().
next())
icon = QIcon(pixmap)
```
Parameters **names** – List of paths to resources in the ZIP file using / as separator

**Returns** A dictionary of the form `{name : file_contents}`. Any names that were not found in the ZIP file will not be present in the dictionary.

genesis()
Setup this plugin. Only called once during initialization. self.gui is available. The action specified by `action_spec` (page 252) is available as `self.qaction`.

`location_selected(loc)`
Called whenever the book list being displayed in calibre changes. Currently values for `loc` are: `library`, `main`, `card` and `cardb`.

This method should enable/disable this action and its sub actions as appropriate for the location.

`library_changed(db)`
Called whenever the current library is changed.

**Parameters** `db` – The LibraryDatabase corresponding to the current library.

gui_layout_complete()
Called once per action when the layout of the main GUI is completed. If your action needs to make changes to the layout, they should be done here, rather than in `initialization_complete()` (page 254).

`initialization_complete()`
Called once per action when the initialization of the main GUI is completed.

`shutting_down()`
Called once per plugin when the main GUI is in the process of shutting down. Release any used resources, but try not to block the shutdown for long periods of time.

**Returns** False to halt the shutdown. You are responsible for telling the user why the shutdown was halted.

class calibre.customize.InterfaceActionBase(*args, **kwargs)
Bases: `calibre.customize.Plugin` (page 230)

`load_actual_plugin(gui)`
This method must return the actual interface action plugin object.

### 11.1.9 Preferences plugins

class calibre.customize.PreferencesPlugin(plugin_path)
Bases: `calibre.customize.Plugin` (page 230)

A plugin representing a widget displayed in the Preferences dialog.

This plugin has only one important method `create_widget()` (page 255). The various fields of the plugin control how it is categorized in the UI.

`config_widget = None`
Import path to module that contains a class named ConfigWidget which implements the ConfigWidget-Interface. Used by `create_widget()` (page 255).

`category_order = 100`
Where in the list of categories the `category` (page 254) of this plugin should be.

`name_order = 100`
Where in the list of names in a category, the `gui_name` (page 255) of this plugin should be

`category = None`
The category this plugin should be in
```python

gui_category = None
The category name displayed to the user for this plugin

gui_name = None
The name displayed to the user for this plugin

icon = None
The icon for this plugin, should be an absolute path

description = None
The description used for tooltips and the like

create_widget (parent=None)
Create and return the actual Qt widget used for setting this group of preferences. The widget must implement the `calibre.gui2.preferences.ConfigWidgetInterface` (page 255).

The default implementation uses `config_widget` (page 254) to instantiate the widget.

class calibre.gui2.preferences.ConfigWidgetInterface
This class defines the interface that all widgets displayed in the Preferences dialog must implement. See `ConfigWidgetBase` (page 255) for a base class that implements this interface and defines various convenience methods as well.

changed_signal = None
This signal must be emitted whenever the user changes a value in this widget

supports_restoring_to_defaults = True
Set to True iff the `restore_to_defaults()` method is implemented.

restore_defaults_desc = u'Restore settings to default values. You have to click Apply to actually save the default settings.'
The tooltip for the “Restore defaults” button

restart_critical = False
If True the Preferences dialog will not allow the user to set any more preferences. Only has effect if `commit()` (page 255) returns True.

genesis (gui)
Called once before the widget is displayed, should perform any necessary setup.

Parameters
gui – The main calibre graphical user interface

initialize ()
Should set all config values to their initial values (the values stored in the config files).

restore_defaults ()
Should set all config values to their defaults.

commit ()
Save any changed settings. Return True if the changes require a restart, False otherwise. Raise an `AbortCommit` exception to indicate that an error occurred. You are responsible for giving the user feedback about what the error is and how to correct it.

refresh gui (gui)
Called once after this widget is committed. Responsible for causing the gui to reread any changed settings.

Note that by default the GUI re-initializes various elements anyway, so most widgets won’t need to use this method.

class calibre.gui2.preferences.ConfigWidgetBase (parent=None)
Base class that contains code to easily add standard config widgets like checkboxes, combo boxes, text fields and so on. See the `register()` (page 256) method.

This class automatically handles change notification, resetting to default, translation between gui objects and config objects, etc. for registered settings.
```

11.1. API documentation for plugins 255
If your config widget inherits from this class but includes settings that are not registered, you should override the `ConfigWidgetInterface` (page 255) methods and call the base class methods inside the overrides.

```python
register(name, config_obj, gui_name=None, choices=None, restart_required=False, empty_string_is_None=True, setting=<class 'calibre.gui2.preferences.Setting'>)
```

Register a setting.

**Parameters**

- `name` – The setting name
- `config` – The config object that reads/writes the setting
- `gui_name` – The name of the GUI object that presents an interface to change the setting. By default it is assumed to be `\'opt_\' + name`.
- `choices` – If this setting is a multiple choice (combobox) based setting, the list of choices. The list is a list of two element tuples of the form: `[(gui name, value), ...]`
- `setting` – The class responsible for managing this setting. The default class handles almost all cases, so this param is rarely used.

```python
initialize()
```

Should set all config values to their initial values (the values stored in the config files).

```python
commit(*args)
```

Save any changed settings. Return True if the changes require a restart, False otherwise. Raise an `AbortCommit` exception to indicate that an error occurred. You are responsible for giving the user feedback about what the error is and how to correct it.

```python
restore_defaults(*args)
```

Should set all config values to their defaults.

### 11.1.10 Viewer plugins

```python
class calibre.customize.ViewerPlugin(plugin_path)
```

Bases: `calibre.customize.Plugin` (page 230)

- `type = u\'Viewer\'`

These plugins are used to add functionality to the calibre E-book viewer.

```python
load_fonts()
```

This method is called once at viewer startup. It should load any fonts it wants to make available. For example:

```python
def load_fonts():
    from PyQt5.Qt import QFontDatabase
    font_data = get_resources(['myfont1.ttf', 'myfont2.ttf'])
    for raw in font_data.itervalues():
        QFontDatabase.addApplicationFontFromData(raw)
```

```python
load_javascript(evaljs)
```

This method is called every time a new HTML document is loaded in the viewer. Use it to load javascript libraries into the viewer. For example:

```python
def load_javascript(self, evaljs):
    js = get_resources('myjavascript.js')
    evaljs(js)
```
run\_javascript \((evaljs)\)
This method is called every time a document has finished loading. Use it in the same way as load\_javascript().

customize\_ui \((ui)\)
This method is called once when the viewer is created. Use it to make any customizations you want to the viewer’s user interface. For example, you can modify the toolbars via ui\_tool\_bar and ui\_tool\_bar2.

customize\_context\_menu \((menu, event, hit\_test\_result)\)
This method is called every time the context (right-click) menu is shown. You can use it to customize the context menu. event is the context menu event and hit\_test\_result is the QWebHitTestResult for this event in the currently loaded document.

11.2 Environment variables

- CALIBRE\_CONFIG\_DIRECTORY - sets the directory where configuration files are stored/read.
- CALIBRE\_TEMP\_DIR - sets the temporary directory used by calibre
- CALIBRE\_CACHE\_DIRECTORY - sets the directory calibre uses to cache persistent data between sessions
- CALIBRE\_OVERRIDE\_DATABASE\_PATH - allows you to specify the full path to metadata.db. Using this variable you can have metadata.db be in a location other than the library folder. Useful if your library folder is on a networked drive that does not support file locking.
- CALIBRE\_DEVELOP\_FROM - Used to run from a calibre development environment. See Setting up a calibre development environment (page 321).
- CALIBRE\_OVERRIDE\_LANG - Used to force the language used by the interface (ISO 639 language code)
- CALIBRE\_TEST\_TRANSLATION - Used to test a translation .po file (should be the path to the .po file)
- CALIBRE\_NO\_NATIVE\_FILEDIALOGS - Causes calibre to not use native file dialogs for selecting files/directories.
- CALIBRE\_NO\_NATIVE\_MENUBAR - Causes calibre to not create a native (global) menu on Ubuntu Unity and similar linux desktop environments. The menu is instead placed inside the window, as is traditional.
- CALIBRE\_USE\_SYSTEM\_THEME - By default, on Linux, calibre uses its own builtin Qt style. This is to avoid crashes and hangs caused by incompatibilities between the version of Qt calibre is built against and the system Qt. The downside is that calibre may not follow the system look and feel. If you set this environment variable on Linux, it will cause calibre to use the system theme – beware of crashes and hangs.
- CALIBRE\_SHOW\_DEPRECIATION\_WARNINGS - Causes calibre to print deprecation warnings to stdout. Useful for calibre developers.
- CALIBRE\_NO\_DEFAULT\_PROGRAMS - Prevent calibre from automatically registering the filetypes it is capable of handling with Windows.
- SYSFS\_PATH - Use if sysfs is mounted somewhere other than /sys
- http\_proxy, https\_proxy - Used on linux to specify an HTTP(S) proxy

See How to set environment variables in Windows\(^98\) or How to set environment variables in macOS\(^99\).

\(^98\) https://www.computerhope.com/issues/ch00549.htm
\(^99\) https://www.dowdandassociates.com/blog/content/how-to-set-an-environment-variable-in-mac-os-x-launchd-plist/
11.3 Tweaks

Tweaks are small changes that you can specify to control various aspects of calibre’s behavior. You can change them by going to Preferences->Advanced->Tweaks. The default values for the tweaks are reproduced below.

```python
#!/usr/bin/env python2
__license__ = 'GPL v3'
__copyright__ = '2010, Kovid Goyal <kovid@kovidgoyal.net>'
__docformat__ = 'restructuredtext en'

'''
Contains various tweaks that affect calibre behavior. Only edit this file if you know what you are doing. If you delete this file, it will be recreated from defaults.
'''

#: Auto increment series index
#: The algorithm used to assign a book added to an existing series a series number. New series numbers assigned using this tweak are always integer values, except if a constant non-integer is specified.
#: Possible values are:
#: next - First available integer larger than the largest existing number
#: first_free - First available integer larger than 0
#: next_free - First available integer larger than the smallest existing number
#: last_free - First available integer smaller than the largest existing number.
#: Return largest existing + 1 if no free number is found
#: const - Assign the number 1 always
#: no_change - Do not change the series index
#: a number - Assign that number always. The number is not in quotes. Note that 0.0 can be used here.
#: Examples:
#: series_index_auto_increment = 'next'
#: series_index_auto_increment = 'next_free'
#: series_index_auto_increment = 16.5
#: Set the use_series_auto_increment_tweak_when_importing tweak to True to use the above values when importing/adding books. If this tweak is set to False (the default) then the series number will be set to 1 if it is not explicitly set during the import. If set to True, then the series index will be set according to the series_index_auto_increment setting.
#: Note that the use_series_auto_increment_tweak_when_importing tweak is used only when a value is not provided during import. If the importing regular expression produces a value for series_index, or if you are reading metadata from books and the import plugin produces a value, than that value will be used irrespective of the setting of the tweak.
series_index_auto_increment = 'next'
use_series_auto_increment_tweak_when_importing = False

#: Add separator after completing an author name
#: Should the completion separator be append to the end of the completed text to automatically begin a new completion operation for authors.
#: Can be either True or False
authors_completer_append_separator = False
```

(continues on next page)
#: Author sort name algorithm
# The algorithm used to copy author to author_sort.
# Possible values are:
# invert: use "fn ln" -> "ln, fn"
# copy : copy author to author_sort without modification
# comma : use 'copy' if there is a ',' in the name, otherwise use 'invert'
# nocomma : "fn ln" -> "ln fn" (without the comma)
# When this tweak is changed, the author_sort values stored with each author
# must be recomputed by right-clicking on an author in the left-hand tags pane,
# selecting 'manage authors', and pressing 'Recalculate all author sort values'.
# The author name suffixes are words that are ignored when they occur at the
# end of an author name. The case of the suffix is ignored and trailing
# periods are automatically handled. The same is true for prefixes.
# The author name copy words are a set of words which if they occur in an
# author name cause the automatically generated author sort string to be
# identical to the author name. This means that the sort for a string like Acme
# Inc. will be Acme Inc. instead of Inc., Acme
author_sort_copy_method = 'comma'
author_name_suffixes = ('Jr', 'Sr', 'Inc', 'Ph.D', 'Phd',
                        'MD', 'M.D', 'I', 'II', 'III', 'IV',
                        'Junior', 'Senior')
author_name_prefixes = ('Mr', 'Mrs', 'Ms', 'Dr', 'Prof')
author_name_copywords = ('Corporation', 'Company', 'Co.', 'Agency', 'Council',
                         'Committee', 'Inc.', 'Institute', 'Society', 'Club', 'Team')

#: Splitting multiple author names
# By default, calibre splits a string containing multiple author names on
# ampersands and the words "and" and "with". You can customize the splitting
# by changing the regular expression below. Strings are split on whatever the
# specified regular expression matches, in addition to ampersands.
# Default: r'(?i),\s+(and|with)\s+'
authors_split_regex = r'(?i),\s+(and|with)\s+'

#: Use author sort in Tag browser
# Set which author field to display in the tags pane (the list of authors,
# series, publishers etc on the left hand side). The choices are author and
# author_sort. This tweak affects only what is displayed under the authors
# category in the tags pane and Content server. Please note that if you set this
# to author_sort, it is very possible to see duplicate names in the list because
# although it is guaranteed that author names are unique, there is no such
# guarantee for author_sort values. Showing duplicates won’t break anything, but
# it could lead to some confusion. When using 'author_sort', the tooltip will
# show the author’s name.
# Examples:
# categories_use_field_for_author_name = 'author'
# categories_use_field_for_author_name = 'author_sort'
categories_use_field_for_author_name = 'author'

#: Control partitioning of Tag browser
# When partitioning the tags browser, the format of the subcategory label is
# controlled by a template: categoriesCollapsedNameTemplate if sorting by
# name, categoriesCollapsedRatingTemplate if sorting by average rating, and
# categoriesCollapsedPopularityTemplate if sorting by popularity. There are
# two variables available to the template: first and last. The variable 'first'
# is the initial item in the subcategory, and the variable 'last' is the final
# item in the subcategory. Both variables are 'objects'; they each have multiple
# values that are obtained by using a suffix. For example, first.1 for an
# author category will be the name of the author. The sub-values available are:
# name: the printable name of the item
# count: the number of books that references this item
# avg_rating: the average rating of all the books referencing this item
# sort: the sort value. For authors, this is the author_sort for that author
# category: the category (e.g., authors, series) that the item is in.
# Note that the "r" in front of the \ is necessary if there are backslashes
# \ characters) in the template. It doesn't hurt anything to leave it there
# even if there aren't any backslashes.
categories_collapsed_name_template = r'{first.sort:shorten(4,,0)} - {last.
—sort:shorten(4,,0)}'
categories_collapsed_rating_template = r'{first.avg_rating:4.2f:ifempty(0)} - {last.
—avg_rating:4.2f:ifempty(0)}'
categories_collapsed_popularity_template = r'{first.count:d} - {last.count:d}'

#: Control order of categories in the Tag browser
#: Change the following dict to change the order that categories are displayed in
#: the Tag browser. Items are named using their lookup name, and will be sorted
#: using the number supplied. The lookup name '* stands for all names that
#: otherwise do not appear. Two names with the same value will be sorted
#: using the default order; the one used when the dict is empty.
#: Example: tag_browser_category_order = {'series':1, 'tags':2, '*':3}
#: resulting in the order series, tags, then everything else in default order.
tag_browser_category_order = {'*':1}

#: Specify columns to sort the booklist by on startup
#: provide a set of columns to be sorted on when calibre starts.
#: the argument is None if saved sort history is to be used
#: otherwise it is a list of column,order pairs. Column is the
#: lookup/search name, found using the tooltip for the column
#: Order is 0 for ascending, 1 for descending.
#: For example, set it to [('authors',0),('title',0)] to sort by
#: title within authors.
sort_columns_at_startup = None

#: Control how dates are displayed
#: Format to be used for publication date and the timestamp (date).
#: A string controlling how the publication date is displayed in the GUI
#: d the day as number without a leading zero (1 to 31)
#: dd the day as number with a leading zero (01 to 31)
#: ddd the abbreviated localized day name (e.g. 'Mon' to 'Sun').
#: dddd the long localized day name (e.g. 'Monday' to 'Sunday').
#: M the month as number without a leading zero (1-12)
#: MM the month as number with a leading zero (01-12)
#: MMM the abbreviated localized month name (e.g. 'Jan' to 'Dec').
#: MMMM the long localized month name (e.g. 'January' to 'December').
#: yy the year as two digit number (00-99)
#: yyyy the year as four digit number
#: h the hours without a leading 0 (0 to 11 or 0 to 23, depending on am/pm) '
#: hh the hours with a leading 0 (00 to 11 or 00 to 23, depending on am/pm) '
#: m the minutes without a leading 0 (0 to 59) '
#: mm the minutes with a leading 0 (00 to 59) '
#: s the seconds without a leading 0 (0 to 59) '
#: ss the seconds with a leading 0 (00 to 59) '
#: ap use a 12-hour clock instead of a 24-hour clock, with "ap" replaced by the
# localized string for am or pm
# AP use a 12-hour clock instead of a 24-hour clock, with "AM" replaced by the
→ localized string for AM or PM
# iso the date with time and timezone. Must be the only format present
# For example, given the date of 9 Jan 2010, the following formats show
# MMM yyyy ==> Jan 2010 yyyy ==> 2010 dd MMM yyyy ==> 09 Jan 2010
# MMM/yyyy ==> 01/2010 d/M/yy ==> 9/1/10 yy ==> 10
#
# publication default if not set: MMM yyyy
# timestamp default if not set: dd MMM yyyy
# last_modified_display_format if not set: dd MMM yyyy
gui_pubdate_display_format = 'MMM yyyy'
gui_timestamp_display_format = 'dd MMM yyyy'
gui_last_modified_display_format = 'dd MMM yyyy'

#: Control sorting of titles and series in the library display
#: Control title and series sorting in the library view. If set to
#: 'library_order', the title sort field will be used instead of the title.
#: Unless you have manually edited the title sort field, leading articles such as
#: The and A will be ignored. If set to 'strictly_alphabetic', the titles will be
#: sorted as-is (sort by title instead of title sort). For example, with
#: library_order, The Client will sort under 'C'. With strictly_alphabetic, the
#: book will sort under 'T'.
#: This flag affects calibre's library display. It has no effect on devices. In
#: addition, titles for books added before changing the flag will retain their
#: order until the title is edited. Editing a title and hitting return
#: without changing anything is sufficient to change the sort. Or you can use
#: the 'Update title sort' action in the Bulk metadata edit dialog to update
#: it for many books at once.
title_series_sorting = 'library_order'

#: Control formatting of title and series when used in templates
#: Control how title and series names are formatted when saving to disk/sending
#: to device. The behavior depends on the field being processed. If processing
#: title, then if this tweak is set to 'library_order', the title will be
#: replaced with title_sort. If it is set to 'strictly_alphabetic', then the
#: title will not be changed. If processing series, then if set to
#: 'library_order', articles such as 'The' and 'An' will be moved to the end. If
#: set to 'strictly_alphabetic', the series will be sent without change.
#: For example, if the tweak is set to library_order, "The Lord of the Rings"
#: will become "Lord of the Rings, The". If the tweak is set to
#: strictly_alphabetic, it would remain "The Lord of the Rings". Note that the
#: formatter function raw_field will return the base value for title and
#: series regardless of the setting of this tweak.
save_template_title_series_sorting = 'library_order'

#: Set the list of words considered to be "articles" for sort strings
#: Set the list of words that are to be considered 'articles' when computing the
#: title sort strings. The articles differ by language. By default, calibre uses
#: a combination of articles from English and whatever language the calibre user
#: interface is set to. In addition, in some contexts where the book language is
#: available, the language of the book is used. You can change the list of
#: articles for a given language or add a new language by editing
#: per_language_title_sort_articles. To tell calibre to use a language other
#: than the user interface language, set, default_language_for_title_sort. For
#: example, to use German, set it to 'deu'. A value of None means the user
#: interface language is used. The setting title_sort_articles is ignored
#: (present only for legacy reasons).
per_language_title_sort_articles = {
    # English

auto_connect_to_folder = ''

#: Specify renaming rules for SONY collections
#: Specify renaming rules for sony collections. This tweak is only applicable if
#: depending upon whether the field is standard or custom. A collection derived
#: from a standard field is named for the value in that field. For example, if
#: the standard 'series' column contains the value 'Darkover', then the
#: collection name is 'Darkover'. A collection derived from a custom field will
#: have the name of the field added to the value. For example, if a custom series
#: column named 'My Series' contains the name 'Darkover', then the collection
#: will by default be named 'Darkover (My Series)'. For purposes of this
documentation, 'Darkover' is called the value and 'My Series' is called the
category. If two books have fields that generate the same collection name,
then both books will be in that collection.
#: This set of tweaks lets you specify for a standard or custom field how
#: the collections are to be named. You can use it to add a description to a
#: standard field, for example 'Foo (Tag)' instead of the 'Foo'. You can also use
#: it to force multiple fields to end up in the same collection. For example, you
could force the values in 'series', '#my_series_1', and '#my_series_2' to
#: appear in collections named 'some_value (Series)', thereby merging all of the
#: fields into one set of collections.
#: There are two related tweaks. The first determines the category name to use
#: for a metadata field. The second is a template, used to determines how the
#: value and category are combined to create the collection name.
#: The syntax of the first tweak, sony_collection_renaming_rules, is:
#: {'field_lookup_name':'category_name_to_use', 'lookup_name':'name', ...}
#: The second tweak, sony_collection_name_template, is a template. It uses the
#: same template language as plugboards and save templates. This tweak controls
#: how the value and category are combined together to make the collection name.
#: The only two fields available are {category} and {value}. The {value} field is
#: never empty. The {category} field can be empty. The default is to put the
#: value first, then the category enclosed in parentheses, it isn't empty:
#: '{value} {category:|(|)}'
#: Examples: The first three examples assume that the second tweak
#: has not been changed.
#: 1: I want three series columns to be merged into one set of collections. The
#: column lookup names are 'series', '#series_1' and '#series_2'. I want nothing
#: in the parenthesis. The value to use in the tweak value would be:
#: sony_collection_renaming_rules=['series':'', '#series_1':'', '#series_2':'']
#: 2: I want the word 'Series' to appear on collections made from series, and
#: the word 'Tag' to appear on collections made from tags. Use:
#: sony_collection_renaming_rules=['series':'Series', 'tags':'Tag']
#: 3: I want 'series' and '#myseries' to be merged, and for the collection name
#: to have '(Series)' appended. The renaming rule is:
#: sony_collection_renaming_rules=['series':'Series', '#myseries':'Series']
#: 4: Same as example 2, but instead of having the category name in parentheses
#: and appended to the value, I want it prepended and separated by a colon, such
#: as in Series: Darkover. I must change the template used to format the category name
#: The resulting two tweaks are:
#: sony_collection_renaming_rules=['series':'Series', 'tags':'Tag']
#: sony_collection_name_template='{category:||: }{value}'
sony_collection_renaming_rules={}
sony_collection_name_template='{value}{category:| {||}}'

#: Specify how SONY collections are sorted
#: Specify how sony collections are sorted. This tweak is only applicable if

(continues on next page)
# metadata management is set to automatic. You can indicate which metadata is to
# be used to sort on a collection-by-collection basis. The format of the tweak
# is a list of metadata fields from which collections are made, followed by the
# name of the metadata field containing the sort value.
# Example: The following indicates that collections built from pubdate and tags
# are to be sorted by the value in the custom column '#mydate', that collections
# built from 'series' are to be sorted by 'series_index', and that all other
# collections are to be sorted by title. If a collection metadata field is not
# named, then if it is a series- based collection it is sorted by series order,
# otherwise it is sorted by title order.
# [{['pubdate', 'tags'], '#mydate'), ({'series'}, 'series_index'), ({'*'}, 'title')]
# Note that the bracketing and parentheses are required. The syntax is
# [ ( [list of fields], sort field ), ( [ list of fields ] , sort field ) ]
# Default: empty (no rules), so no collection attributes are named.
sony_collection_sorting_rules = []

#: Control how tags are applied when copying books to another library
#: Set this to True to ensure that tags in 'Tags to add when adding
#: a book' are added when copying books to another library
add_new_book_tags_when_importing_books = False

#: Set custom metadata fields that the Content server will or will not display.
#: Controls what fields are displayed when clicking the "Search" button in the
#: browser to search your calibre library.
#: content_server_will_display is a list of custom fields to be displayed.
#: content_server_wont_display is a list of custom fields not to be displayed.
#: wont_display has priority over will_display.
#: The special value '*' means all custom fields. The value [] means no entries.
#: Defaults:
#: content_server_will_display = ['*']
#: content_server_wont_display = []
#
#: Examples:
#: # To display only the custom fields #mytags and #genre:
#: content_server_will_display = ['#mytags', '#genre']
#: content_server_wont_display = []
#: # To display all fields except #mycomments:
#: content_server_will_display = ['*']
#: content_server_wont_display [#mycomments']
#: content_server_will_display = ['*']
#: content_server_wont_display = []

#: Set the maximum number of sort 'levels'
#: Set the maximum number of sort 'levels' that calibre will use to resort the
#: library after certain operations such as searches or device insertion. Each
#: sort level adds a performance penalty. If the database is large (thousands of
#: books) the penalty might be noticeable. If you are not concerned about multi-
#: level sorts, and if you are seeing a slowdown, reduce the value of this tweak.
maximum_resort_levels = 5

#: Choose whether dates are sorted using visible fields
#: Date values contain both a date and a time. When sorted, all the fields are
#: used, regardless of what is displayed. Set this tweak to True to use only
#: the fields that are being displayed.
sort_dates_using_visible_fields = False
#: Fuzz value for trimming covers
#: The value used for the fuzz distance when trimming a cover.
#: Colors within this distance are considered equal.
#: The distance is in absolute intensity units.
cover_trim_fuzz_value = 10

#: Control behavior of the book list
#: You can control the behavior of double clicks and pressing enter on the books list.
#: Choices: open_viewer, do_nothing, edit_cell, edit_metadata. Selecting anything other than open_viewer has the
#: side effect of disabling editing a field using a single click.
#: Default: open_viewer.
#: Example: doubleclick_on_library_view = 'do_nothing'
#: You can also control whether the book list scrolls horizontal per column or
#: per pixel. Default is per column.
#: doubleclick_on_library_view = 'open_viewer'
#: enter_key_behavior = 'do_nothing'
horizontal_scrolling_per_column = True

#: Language to use when sorting
#: Setting this tweak will force sorting to use the
#: collating order for the specified language. This might be useful if you run
#: calibre in English but want sorting to work in the language where you live.
#: Set the tweak to the desired ISO 639-1 language code, in lower case.
#: You can find the list of supported locales at
#: Default: locale_for_sorting = '' -- use the language calibre displays in
#: Example: locale_for_sorting = 'fr' -- sort using French rules.
#: Example: locale_for_sorting = 'nb' -- sort using Norwegian rules.
locale_for_sorting = ''

#: Number of columns for custom metadata in the edit metadata dialog
#: Set whether to use one or two columns for custom metadata when editing
#: metadata one book at a time. If True, then the fields are laid out using two
#: columns. If False, one column is used.
metadata_single_use_2_cols_for_custom_fields = True

#: Order of custom column(s) in edit metadata
#: Controls the order that custom columns are listed in edit metadata single
#: and bulk. The columns listed in the tweak are displayed first and in the
#: order provided. Any columns not listed are displayed after the listed ones,
#: in alphabetical order. Do note that this tweak does not change the size of
#: the edit widgets. Putting comments widgets in this list may result in some
#: odd widget spacing when using two-column mode.
#: Enter a comma-separated list of custom field lookup names, as in
#: metadata_edit_custom_column_order = ['#genre', '#mytags', '#etc']
metadata_edit_custom_column_order = []

#: The number of seconds to wait before sending emails
#: The number of seconds to wait before sending emails when using a
#: public email server like gmx/hotmail/gmail. Default is: 5 minutes
#: Setting it to lower may cause the server's SPAM controls to kick in,
#: making email sending fail. Changes will take effect only after a restart of
#: calibre. You can also change the list of hosts that calibre considers
#: to be public relays here. Any relay host ending with one of the suffixes
#: in the list below will be considered a public email server.

public_smtp_relay_delay = 301
public_smtp_relay_host_suffixes = ['gmail.com', 'live.com', 'gmx.com']

#: The maximum width and height for covers saved in the calibre library
#: All covers in the calibre library will be resized, preserving aspect ratio,
#: to fit within this size. This is to prevent slowdowns caused by extremely
#: large covers
maximum_cover_size = (1650, 2200)

#: Where to send downloaded news
#: When automatically sending downloaded news to a connected device, calibre
#: will by default send it to the main memory. By changing this tweak, you can
#: control where it is sent. Valid values are "main", "carda", "cardb". Note
#: that if there isn’t enough free space available on the location you choose,
#: the files will be sent to the location with the most free space.
send_news_to_device_location = "main"

#: Unified toolbar on macOS
#: If you enable this option and restart calibre, the toolbar will be 'unified'
#: with the titlebar as is normal for macOS applications. However, doing this has
#: various bugs; for instance, the minimum width of the toolbar becomes twice
#: what it should be and it causes other random bugs on some systems, so turn it
#: on at your own risk!
unified_title_toolbar_on_osx = False

#: Save original file when converting/polishing from same format to same format
#: When calibre does a conversion from the same format to the same format, for
#: example, from EPUB to EPUB, the original file is saved, so that in case the
#: conversion is poor, you can tweak the settings and run it again. By setting
#: this to False you can prevent calibre from saving the original file.
#: Similarly, by setting save_original_format_when_polishing to False you can
#: prevent calibre from saving the original file when polishing.
save_original_format = True
save_original_format_when_polishing = True

#: Number of recently viewed books to show
#: Right-clicking the "View" button shows a list of recently viewed books. Control
#: how many should be shown, here.
 gui_view_history_size = 15

#: Change the font size of book details in the interface
#: Change the font size at which book details are rendered in the side panel and
#: comments are rendered in the metadata edit dialog. Set it to a positive or
#: negative number to increase or decrease the font size.
change_book_details_font_size_by = 0

#: What format to default to when using the "Unpack book" feature
#: The "Unpack book" feature of calibre allows direct editing of a book format.
#: If multiple formats are available, calibre will offer you a choice
#: of formats, defaulting to your preferred output format if it is available.
#: Set this tweak to a specific value of 'EPUB' or 'AZW3' to always default
#: to that format rather than your output format preference.
#: Set to a value of 'remember' to use whichever format you chose last time you
#: used the "Unpack book" feature.
#: Examples:
#: default_tweak_format = None     (Use output format)
#: default_tweak_format = 'EPUB'
```python
# default_tweak_format = 'remember'
default_tweak_format = None

#: Do not preselect a completion when editing authors/tags/series/etc.
#: This means that you can make changes and press Enter and your changes will
#: not be overwritten by a matching completion. However, if you wish to use the
#: completions you will now have to press Tab to select one before pressing
#: Enter. Which technique you prefer will depend on the state of metadata in
#: your library and your personal editing style.
preselect_first_completion = False

#: Completion mode when editing authors/tags/series/etc.
#: By default, when completing items, calibre will show you all the candidates
#: that start with the text you have already typed. You can instead have it show
#: all candidates that contain the text you have already typed. To do this, set
#: completion_mode to 'contains'. For example, if you type asi it will match both
#: Asimov and Quasimodo, whereas the default behavior would match only Asimov.
completion_mode = 'prefix'

#: Recognize numbers inside text when sorting
#: This means that when sorting on text fields like title the text "Book 2"
#: will sort before the text "Book 100". If you want this behavior, set
#: numeric_collation = True note that doing so will cause problems with text
#: that starts with numbers and is a little slower.
numeric_collation = False

#: Sort the list of libraries alphabetically
#: The list of libraries in the Copy to library and Quick switch menus are
#: normally sorted by most used. However, if there are more than a certain
#: number of such libraries, the sorting becomes alphabetic. You can set that
#: number here. The default is ten libraries.
many_libraries = 10

#: Choose available output formats for conversion
#: Restrict the list of available output formats in the conversion dialogs.
#: For example, if you only want to convert to EPUB and AZW3, change this to
#: restrict_output_formats = ['EPUB', 'AZW3']. The default value of None causes
#: all available output formats to be present.
restrict_output_formats = None

#: Set the thumbnail image quality used by the Content server
#: The quality of a thumbnail is largely controlled by the compression quality
#: used when creating it. Set this to a larger number to improve the quality.
#: Note that the thumbnails get much larger with larger compression quality
#: numbers.
#: The value can be between 50 and 99
content_server_thumbnail_compression_quality = 75

#: Image file types to treat as e-books when dropping onto the "Book details" panel
#: Normally, if you drop any image file in a format known to calibre onto the
#: "Book details" panel, it will be used to set the cover. If you want to store
#: some image types as e-books instead, you can set this tweak.
#: Examples:
#: cover_drop_exclude = {'tiff', 'webp'}
cover_drop_exclude = ()

#: Show the Saved searches box in the Search bar
```
# In newer versions of calibre, only a single button that allows you to add a
# new Saved search is shown in the Search bar. If you would like to have the
# old Saved searches box with its two buttons back, set this tweak to True.
show_saved_search_box = False

#: Exclude fields when copy/pasting metadata
#: You can ask calibre to not paste some metadata fields when using the
#: Edit metadata->Copy metadata/Paste metadata actions. For example,
#: exclude_fields_on_paste = ['cover', 'timestamp', '#mycolumn']
#: to prevent pasting of the cover, Date and custom column, mycolumn.
exclude_fields_on_paste = []

#: Skip internet connected check
#: Skip checking whether the internet is available before downloading news.
#: Useful if for some reason your operating systems network checking
#: facilities are not reliable (for example NetworkManager on Linux).
skip_network_check = False

## 11.4 Overriding icons, templates, et cetera

**Note:** calibre has direct support for icon themes, there are several icon themes available for calibre, that you can use
by going to Preferences→Interface→Look & Feel→Change Icon theme. The icon themes use the same mechanism
as described below for overriding static resources.

Calibre allows you to override the static resources, like icons, javascript and templates for the metadata jacket, cat-
альных, etc. with customized versions that you like. All static resources are stored in the resources sub-folder of the
calibre install location. On Windows, this is usually `C:\Program Files\Calibre2\resources`. On macOS,
/Applications/calibre.app/Contents/Resources/resources/. On linux, if you are using the bi-
inary installer from the calibre website it will be /opt/calibre/resources. These paths can change depending
on where you choose to install calibre.

You should not change the files in this resources folder, as your changes will get overwritten the next time you update
calibre. Instead, go to Preferences→Advanced→Miscellaneous and click Open calibre configuration directory. In this
configuration directory, create a sub-folder called resources and place the files you want to override in it. Place the files
in the appropriate sub folders, for example place images in resources/images, etc. calibre will automatically use
your custom file in preference to the built-in one the next time it is started.

For example, if you wanted to change the icon for the Remove books action, you would first look in the built-in
resources folder and see that the relevant file is resources/images/remove_books.png. Assuming you have
an alternate icon in PNG format called my_remove_books.png you would save it in the configuration directory as
resources/images/remove_books.png. All the icons used by the calibre user interface are in resources/
images and its sub-folders.

## 11.5 Creating your own icon theme for calibre

If you have created a beautiful set of icons and wish to share them with other calibre users via cali-
bre’s builtin icon theme support, you can easily package up your icons into a theme. To do so, go to
Preferences→Miscellaneous→Create icon theme, select the folder where you have put your icons (usually the
resources/images folder in the calibre config directory, as described above). Then fill up the theme metadata
and click OK. This will result in a ZIP file containing the theme icons. You can upload that to the calibre forum at Mobileread\textsuperscript{100} and then I will make your theme available via calibre’s builtin icon theme system.

### 11.6 Customizing calibre with plugins

Calibre has a very modular design. Almost all functionality in calibre comes in the form of plugins. Plugins are used for conversion, for downloading news (though these are called recipes), for various components of the user interface, to connect to different devices, to process files when adding them to calibre and so on. You can get a complete list of all the built-in plugins in calibre by going to Preferences→Advanced→Plugins.

You can write your own plugins to customize and extend the behavior of calibre. The plugin architecture in calibre is very simple, see the tutorial \textit{Writing your own plugins to extend calibre’s functionality} (page 203).

\textsuperscript{100} https://www.mobileread.com/forums/forumdisplay.php?f=166
CHAPTER 12

Command Line Interface

Note: On macOS, the command line tools are inside the calibre bundle, for example, if you installed calibre in /Applications the command line tools are in /Applications/calibre.app/Contents/console.app/Contents/MacOS/.

12.1 Documented commands

12.1.1 calibre

```
calibre [options] [path_to_ebook]
```

Launch the main calibre Graphical User Interface and optionally add the e-book at path_to_ebook to the database. Whenever you pass arguments to calibre that have spaces in them, enclose the arguments in quotation marks. For example: “/some path/with spaces”

[options]

--detach
  Detach from the controlling terminal, if any (Linux only)

--help, -h
  Show this help message and exit

--ignore-plugins
  Ignore custom plugins, useful if you installed a plugin that is preventing calibre from starting
--no-update-check
   Do not check for updates

--shutdown-running-calibre, -s
   Cause a running calibre instance, if any, to be shutdown. Note that if there are running jobs, they will be silently aborted, so use with care.

--start-in-tray
   Start minimized to system tray.

--verbose, -v
   Ignored, do not use. Present only for legacy reasons

--version
   show program ’s version number and exit

--with-library
   Use the library located at the specified path.

12.1.2 calibre-customize

calibre-customize options

Customize calibre by loading external plugins.
Whenever you pass arguments to calibre-customize that have spaces in them, enclose the arguments in quotation marks. For example: “/some path/with spaces”

[options]

--add-plugin, -a
   Add a plugin by specifying the path to the ZIP file containing it.

--build-plugin, -b
   For plugin developers: Path to the directory where you are developing the plugin. This command will automatically zip up the plugin and update it in calibre.

--customize-plugin
   Customize plugin. Specify name of plugin and customization string separated by a comma.

--disable-plugin
   Disable the named plugin

--enable-plugin
   Enable the named plugin

--help, -h
   show this help message and exit

--list-plugins, -l
   List all installed plugins

--remove-plugin, -r
   Remove a custom plugin by name. Has no effect on builtin plugins

--version
   show program ’s version number and exit
12.1.3 calibre-debug

```
calibre-debug [options]
```

Various command line interfaces useful for debugging calibre. With no options, this command starts an embedded Python interpreter. You can also run the main calibre GUI, the calibre viewer and the calibre editor in debug mode.

It also contains interfaces to various bits of calibre that do not have dedicated command line tools, such as font subsetting, the e-book diff tool and so on.

You can also use `calibre-debug` to run standalone scripts. To do that use it like this:

```
calibre-debug myscript.py -- --option1 --option2 file1 file2 ...
```

Everything after the `--` is passed to the script.

Whenever you pass arguments to `calibre-debug` that have spaces in them, enclose the arguments in quotation marks. For example: "/some path/with spaces"

[options]

```
--add-simple-plugin
  Add a simple plugin (i.e. a plugin that consists of only a .py file), by specifying the path to the py file containing the plugin code.

--command, -c
  Run Python code.

--debug-device-driver, -d
  Debug device detection

--default-programs
  (Un)register calibre from Windows Default Programs. `--default-programs` (page 273) = (register|unregister)

--diff
  Run the calibre diff tool. For example: calibre-debug `--diff` (page 273) file1 file2

--edit-book, -t
  Launch the calibre "Edit book" tool in debug mode.

--exec-file, -e
  Run the Python code in file.

--explode-book, -x
  Explode the book into the specified directory. Usage: -x file.epub output_dir Exports the book as a collection of HTML files and metadata, which you can edit using standard HTML editing tools. Works with EPUB, AZW3, HTMLZ and DOCX files.

--export-all-calibre-data
  Export all calibre data (books/settings/plugins). Normally, you will be asked for the export dir and the libraries to export. You can also specify them as command line arguments to skip the questions. Use absolute paths for the export directory and libraries. The special keyword "all" can be used to export all libraries.

--gui, -g
  Run the GUI with debugging enabled. Debug output is printed to stdout and stderr.

--gui-debug
  Run the GUI with a debug console, logging to the specified path. For internal use only, use the -g option to run the GUI in debug mode.
--help, -h
    show this help message and exit

--implode-book, -i
    Implode a previously exploded book. Usage: -i output_dir file.epub Imports the book from the files in output_dir which must have been created by a previous call to --explode-book (page 273). Be sure to specify the same file type as was used when exploding.

--import-calibre-data
    Import previously exported calibre data

--inspect-mobi, -m
    Inspect the MOBI file(s) at the specified path(s)

--paths
    Output the paths necessary to setup the calibre environment

--reinitialize-db
    Re-initialize the sqlite calibre database at the specified path. Useful to recover from db corruption.

--run-plugin, -r
    Run a plugin that provides a command line interface. For example: calibre-debug -r "Add Books" -- file1 --option1 Everything after the -- will be passed to the plugin as arguments.

--shutdown-running-calibre, -s
    Cause a running calibre instance, if any, to be shutdown. Note that if there are running jobs, they will be silently aborted, so use with care.

--subset-font, -f
    Subset the specified font. Use -- after this option to pass option to the font subsetting program.

--test-build
    Test binary modules in build

--version
    show program 's version number and exit

--viewer, -w
    Run the E-book viewer in debug mode

12.1.4 calibre-server

calibre-server [options] [path to library folder...]

Start the calibre Content server. The calibre Content server exposes your calibre libraries over the internet. You can specify the path to the library folders as arguments to calibre-server. If you do not specify any paths, all the libraries that the main calibre program knows about will be used.

Whenever you pass arguments to calibre-server that have spaces in them, enclose the arguments in quotation marks. For example: “/some path/with spaces”

[options]

--access-log
    Path to the access log file. This log contains information about clients connecting to the server and making requests. By default no access logging is done.

--ajax-timeout
    Time (in seconds) to wait for a response from the server when making queries.
**--auth-mode**
Choose the type of authentication used. Set the HTTP authentication mode used by the server. Set to "basic" if you are putting this server behind an SSL proxy. Otherwise, leave it as "auto", which will use "basic" if SSL is configured otherwise it will use "digest".

**--auto-reload**
Automatically reload server when source code changes. Useful for development. You should also specify a small value for the shutdown timeout.

**--ban-after**
Number of login failures for ban. The number of login failures after which an IP address is banned.

**--ban-for**
Ban IP addresses that have repeated login failures. Temporarily bans access for IP addresses that have repeated login failures for the specified number of minutes. Useful to prevent attempts at guessing passwords. If set to zero, no banning is done.

**--compress-min-size**
Minimum size for which responses use data compression (in bytes).

**--custom-list-template**
Path to a JSON file containing a template for the custom book list mode. The easiest way to create such a template file is to go to Preferences-> Sharing over the net-> Book list template in calibre, create the template and export it.

**--daemonize**
Run process in background as a daemon (Linux only).

**--displayed-fields**
Restrict displayed user-defined fields. Comma separated list of user-defined metadata fields that will be displayed by the Content server in the /opds and /mobile views. If you specify this option, any fields not in this list will not be displayed. For example: my_rating,my_tags

**--enable-allow-socket-preallocation, --disable-allow-socket-preallocation**
Socket pre-allocation, for example, with systemd socket activation. By default, this option is enabled.

**--enable-auth, --disable-auth**
Password based authentication to access the server. Normally, the server is unrestricted, allowing anyone to access it. You can restrict access to predefined users with this option. By default, this option is disabled.

**--enable-fallback-to-detected-interface, --disable-fallback-to-detected-interface**
Fallback to auto-detected interface. If for some reason the server is unable to bind to the interface specified in the listen on option, then it will try to detect an interface that connects to the outside world and bind to that. By default, this option is enabled.

**--enable-local-write, --disable-local-write**
Allow un-authenticated local connections to make changes. Normally, if you do not turn on authentication, the server operates in read-only mode, so as to not allow anonymous users to make changes to your calibre libraries. This option allows anybody connecting from the same computer as the server is running on to make changes. This is useful if you want to run the server without authentication but still use calibredb to make changes to your calibre libraries. Note that turning on this option means any program running on the computer can make changes to your calibre libraries. By default, this option is disabled.

**--enable-log-not-found, --disable-log-not-found**
Log HTTP 404 (Not Found) requests. Normally, the server logs all HTTP requests for resources that are not found. This can generate a lot of log spam, if your server is targeted by bots. Use this option to turn it off. By default, this option is enabled.

**--enable-use-bonjour, --disable-use-bonjour**
Advertise OPDS feeds via BonJour. Advertise the OPDS feeds via the BonJour service, so that OPDS based...
reading apps can detect and connect to the server automatically. By default, this option is enabled.

**--enable-use-sendfile, --disable-use-sendfile**  
Zero copy file transfers for increased performance. This will use zero-copy in-kernel transfers when sending files over the network, increasing performance. However, it can cause corrupted file transfers on some broken filesystems. If you experience corrupted file transfers, turn it off. By default, this option is enabled.

**--help, -h**  
show this help message and exit

**--ignored-fields**  
Ignored user-defined metadata fields. Comma separated list of user-defined metadata fields that will not be displayed by the Content server in the /opds and /mobile views. For example: my_rating,my_tags

**--listen-on**  
The interface on which to listen for connections. The default is to listen on all available interfaces. You can change this to, for example, "127.0.0.1" to only listen for connections from the local machine, or to "::" to listen to all incoming IPv6 and IPv4 connections.

**--log**  
Path to log file for server log. This log contains server information and errors, not access logs. By default it is written to stdout.

**--manage-users**  
Manage the database of users allowed to connect to this server. See also the **--userdb** (page 277) option.

**--max-header-line-size**  
Max. size of single HTTP header (in KB).

**--max-job-time**  
Maximum time for worker processes. Maximum amount of time worker processes are allowed to run (in minutes). Set to zero for no limit.

**--max-jobs**  
Maximum number of worker processes. Worker processes are launched as needed and used for large jobs such as preparing a book for viewing, adding books, converting, etc. Normally, the max. number of such processes is based on the number of CPU cores. You can control it by this setting.

**--max-log-size**  
Max. log file size (in MB). The maximum size of log files, generated by the server. When the log becomes larger than this size, it is automatically rotated. Set to zero to disable log rotation.

**--max-opds-items**  
Maximum number of books in OPDS feeds. The maximum number of books that the server will return in a single OPDS acquisition feed.

**--max-opds-ungrouped-items**  
Maximum number of ungrouped items in OPDS feeds. Group items in categories such as author/tags by first letter when there are more than this number of items. Set to zero to disable.

**--max-request-body-size**  
Max. allowed size for files uploaded to the server (in MB).

**--num-per-page**  
Number of books to show in a single page. The number of books to show in a single page in the browser.

**--pidfile**  
Write process PID to the specified file

**--port**  
The port on which to listen for connections.
calibre User Manual, Release 3.33.1

--shutdown-timeout
Total time in seconds to wait for clean shutdown.

--ssl-certfile
Path to the SSL certificate file.

--ssl-keyfile
Path to the SSL private key file.

--timeout
Time (in seconds) after which an idle connection is closed.

--url-prefix
A prefix to prepend to all URLs. Useful if you wish to run this server behind a reverse proxy. For example use, /calibre as the URL prefix.

--userdb
Path to the user database to use for authentication. The database is a SQLite file. To create it use --manage-users (page 276). You can read more about managing users at: https://manual.calibre-ebook.com/server.html#managing-user-accounts-from-the-command-line-only

--version
Show program’s version number and exit

--worker-count
Number of worker threads used to process requests.

12.1.5 calibre-smtp

```
calibre-smtp [options] [from to text]
```

Send mail using the SMTP protocol. calibre-smtp has two modes of operation. In the compose mode you specify from to and text and these are used to build and send an email message. In the filter mode, calibre-smtp reads a complete email message from STDIN and sends it.

text is the body of the email message. If text is not specified, a complete email message is read from STDIN. from is the email address of the sender and to is the email address of the recipient. When a complete email is read from STDIN, from and to are only used in the SMTP negotiation, the message headers are not modified.

Whenever you pass arguments to calibre-smtp that have spaces in them, enclose the arguments in quotation marks. For example: “/some path/with spaces”

[options]

--fork, -f
Fork and deliver message in background. If you use this option, you should also use --outbox (page 277) to handle delivery failures.

--help, -h
Show this help message and exit

--localhost, -l
Host name of localhost. Used when connecting to SMTP server.

--outbox, -o
Path to maildir folder to store failed email messages in.

--timeout, -t
Timeout for connection

12.1. Documented commands
--verbose, -v  
Be more verbose

--version  
show program's version number and exit

COMPOSE MAIL

Options to compose an email. Ignored if text is not specified

--attachment, -a  
File to attach to the email

--subject, -s  
Subject of the email

SMTP RELAY

Options to use an SMTP relay server to send mail. calibre will try to send the email directly unless --relay is specified.

--cafile  
Path to a file of concatenated CA certificates in PEM format, used to verify the server certificate when using TLS. By default, the system CA certificates are used.

--dont-verify-server-certificate  
Do not verify the server certificate when connecting using TLS. This used to be the default behavior in calibre versions before 3.27. If you are using a relay with a self-signed or otherwise invalid certificate, you can use this option to restore the pre 3.27 behavior

--encryption-method, -e  
Encryption method to use when connecting to relay. Choices are TLS, SSL and NONE. Default is TLS. WARNING: Choosing NONE is highly insecure

--password, -p  
Password for relay

--port  
Port to connect to on relay server. Default is to use 465 if encryption method is SSL and 25 otherwise.

--relay, -r  
An SMTP relay server to use to send mail.

--username, -u  
Username for relay

12.1.6 calibredb

```
calibredb command [options] [arguments]
```

calibredb is the command line interface to the calibre database. It has several sub-commands, documented below.

calibredb can be used to manipulate either a calibre database specified by path or a calibre Content server running either on the local machine or over the internet. You can start a calibre Content server using either the calibre-server program or in the main calibre program click Connect/share → Start Content server. Since calibredb can make changes to your calibre libraries, you must setup authentication on the server first. There are two ways to do that:
• If you plan to connect only to a server running on the same computer, you can simply use the
--enable-local-write option of the content server, to allow any program, including calibredb, running
on the local computer to make changes to your calibre data. When running the server from the main calibre
program, this option is in Preferences→Sharing over the net→Advanced.

• If you want to enable access over the internet, then you should setup user accounts on the server and use
the --username (page 280) and --password (page 280) options to calibredb to give it access. You
can setup user authentication for calibre-server by using the --enable-auth option and using
--manage-users to create the user accounts. If you are running the server from the main calibre program,
use Preferences→Sharing over the net→Require username/password.

To connect to a running Content server, pass the URL of the server to the --with-library (page 280) option, see
the documentation of that option for details and examples.
Global Options

--help, -h
show this help message and exit

--library-path, --with-library
Path to the calibre library. Default is to use the path stored in the settings. You can also connect to a calibre Content server to perform actions on remote libraries. To do so use a URL of the form: http://hostname:port/#library_id for example, http://localhost:8080/#mylibrary. library_id is the library id of the library you want to connect to on the Content server. You can use the special library_id value of - to get a list of library ids available on the server. For details on how to setup access via a Content server, see https://manual.calibre-ebook.com/generated/en/calibredb.html.

--password
Password for connecting to a calibre Content server. To read the password from standard input, use the special value: <stdin>. To read the password from a file, use: <f:/path/to/file> (i.e. <f: followed by the full path to the file and a trailing >). The angle brackets in the above are required, remember to escape them or use quotes for your shell.

--username
Username for connecting to a calibre Content server

--version
show program 's version number and exit

list

```
calibredb list [options]
```

List the books available in the calibre database. Whenever you pass arguments to calibredb that have spaces in them, enclose the arguments in quotation marks. For example: “/some path/with spaces”

--ascending
Sort results in ascending order

--fields, -f
The fields to display when listing books in the database. Should be a comma separated list of fields. Available fields: author_sort, authors, comments, cover, formats, identifiers, isbn, languages, last_modified, pubdate, publisher, rating, series, series_index, size, tags, timestamp, title, uuid Default: title,authors. The special field "all" can be used to select all fields. In addition to the builtin fields above, custom fields are also available as *field_name, for example, for a custom field #rating, use the name: *rating

--for-machine
Generate output in JSON format, which is more suitable for machine parsing. Causes the line width and separator options to be ignored.

--limit
The maximum number of results to display. Default: all

--line-width, -w
The maximum width of a single line in the output. Defaults to detecting screen size.

--prefix
The prefix for all file paths. Default is the absolute path to the library folder.
--search, -s
Filter the results by the search query. For the format of the search query, please see the search related documentation in the User Manual. Default is to do no filtering.

--separator
The string used to separate fields. Default is a space.

--sort-by
The field by which to sort the results. Available fields: author_sort, authors, comments, cover, formats, identifiers, isbn, languages, last_modified, pubdate, publisher, rating, series, series_index, size, tags, timestamp, title, uuid Default: id

add

`calibredb add [options] file1 file2 file3 ...`

Add the specified files as books to the database. You can also specify directories, see the directory related options below.

Whenever you pass arguments to calibredb that have spaces in them, enclose the arguments in quotation marks. For example: “/some path/with spaces”

--authors, -a
Set the authors of the added book(s)

--cover, -c
Path to the cover to use for the added book

--duplicates, -d
Add books to database even if they already exist. Comparison is done based on book titles.

--empty, -e
Add an empty book (a book with no formats)

--identifier, -I
Set the identifiers for this book, for e.g. -I asin:XXX -I isbn:YYY

--isbn, -i
Set the ISBN of the added book(s)

--languages, -l
A comma separated list of languages (best to use ISO639 language codes, though some language names may also be recognized)

--series, -s
Set the series of the added book(s)

--series-index, -S
Set the series number of the added book(s)

--tags, -T
Set the tags of the added book(s)

--title, -t
Set the title of the added book(s)
Adding From Directories

Options to control the adding of books from directories. By default only files that have extensions of known e-book file types are added.

--add
A filename (glob) pattern, files matching this pattern will be added when scanning directories for files, even if they are not of a known e-book file type. Can be specified multiple times for multiple patterns.

--ignore
A filename (glob) pattern, files matching this pattern will be ignored when scanning directories for files. Can be specified multiple times for multiple patterns. For e.g.: *.pdf will ignore all pdf files

--one-book-per-directory, -1
Assume that each directory has only a single logical book and that all files in it are different e-book formats of that book

--recurse, -r
Process directories recursively

remove

```
calibredb remove ids
```

Remove the books identified by ids from the database. ids should be a comma separated list of id numbers (you can get id numbers by using the search command). For example, 23,34,57-85 (when specifying a range, the last number in the range is not included).

Whenever you pass arguments to calibredb that have spaces in them, enclose the arguments in quotation marks. For example: “/some path/with spaces”

--permanent
Do not use the recycle bin

add_format

```
calibredb add_format [options] id ebook_file
```

Add the e-book in ebook_file to the available formats for the logical book identified by id. You can get id by using the search command. If the format already exists, it is replaced, unless the do not replace option is specified.

Whenever you pass arguments to calibredb that have spaces in them, enclose the arguments in quotation marks. For example: “/some path/with spaces”

--dont-replace
Do not replace the format if it already exists

remove_format

```
calibredb remove_format [options] id fmt
```

Remove the format fmt from the logical book identified by id. You can get id by using the search command. fmt should be a file extension like LRF or TXT or EPUB. If the logical book does not have fmt available, do nothing.

Whenever you pass arguments to calibredb that have spaces in them, enclose the arguments in quotation marks. For example: “/some path/with spaces”
show_metadata

calibredb show_metadata [options] id

Show the metadata stored in the calibre database for the book identified by id. id is an id number from the search command.

Whenever you pass arguments to calibredb that have spaces in them, enclose the arguments in quotation marks. For example: “/some path/with spaces”

--as-opf
Print metadata in OPF form (XML)

set_metadata

calibredb set_metadata [options] id [/path/to/metadata.opf]

Set the metadata stored in the calibre database for the book identified by id from the OPF file metadata.opf. id is an id number from the search command. You can get a quick feel for the OPF format by using the –as-opf switch to the show_metadata command. You can also set the metadata of individual fields with the –field option. If you use the –field option, there is no need to specify an OPF file.

Whenever you pass arguments to calibredb that have spaces in them, enclose the arguments in quotation marks. For example: “/some path/with spaces”

--field, -f
The field to set. Format is field_name:value, for example: --field (page 283) tags:tag1,tag2. Use --list-fields (page 283) to get a list of all field names. You can specify this option multiple times to set multiple fields. Note: For languages you must use the ISO639 language codes (e.g. en for English, fr for French and so on). For identifiers, the syntax is --field (page 283) identifiers:isbn:XXXX,doi:YYYYY. For boolean (yes/no) fields use true and false or yes and no.

--list-fields, -l
List the metadata field names that can be used with the --field (page 283) option

export

calibredb export [options] ids

Export the books specified by ids (a comma separated list) to the filesystem. The export operation saves all formats of the book, its cover and metadata (in an opf file). You can get id numbers from the search command.

Whenever you pass arguments to calibredb that have spaces in them, enclose the arguments in quotation marks. For example: “/some path/with spaces”

--all
Export all books in database, ignoring the list of ids.

--dont-asciiize
Normally, calibre will convert all non English characters into English equivalents for the file names. WARNING: If you turn this off, you may experience errors when saving, depending on how well the filesystem you are saving to supports unicode. Specifying this switch will turn this behavior off.

--dont-save-cover
Normally, calibre will save the cover in a separate file along with the actual e-book files. Specifying this switch will turn this behavior off.

12.1. Documented commands
**--dont-update-metadata**
Normally, calibre will update the metadata in the saved files from what is in the calibre library. Makes saving to disk slower. Specifying this switch will turn this behavior off.

**--dont-write-opf**
Normally, calibre will write the metadata into a separate OPF file along with the actual e-book files. Specifying this switch will turn this behavior off.

**--formats**
Comma separated list of formats to save for each book. By default all available formats are saved.

**--progress**
Report progress

**--replace-whitespace**
Replace whitespace with underscores.

**--single-dir**
Export all books into a single directory

**--template**
The template to control the filename and directory structure of the saved files. Default is "{author_sort}/{title}/{title} - {authors}" which will save books into a per-author subdirectory with filenames containing title and author. Available controls are: {author_sort, authors, id, isbn, languages, last_modified, pubdate, publisher, rating, series, series_index, tags, timestamp, title}

**--timefmt**
The format in which to display dates. %d - day, %b - month, %m - month number, %Y - year. Default is: %b, %Y

**--to-dir**
Export books to the specified directory. Default is .

**--to-lowercase**
Convert paths to lowercase.

**catalog**

`calibredb catalog /path/to/destination.(csv|epub|mobi|xml...) [options]`

Export a catalog in format specified by path/to/destination extension. Options control how entries are displayed in the generated catalog output. Note that different catalog formats support different sets of options.

Whenever you pass arguments to calibredb that have spaces in them, enclose the arguments in quotation marks. For example: “/some path/with spaces”

**--ids, -i**
Comma-separated list of database IDs to catalog. If declared, --search (page 284) is ignored. Default: all

**--search, -s**
Filter the results by the search query. For the format of the search query, please see the search-related documentation in the User Manual. Default: no filtering

**--verbose, -v**
Show detailed output information. Useful for debugging
Epub Options

--catalog-title
Title of generated catalog used as title in metadata. Default: 'My Books' Applies to: AZW3, EPUB, MOBI output formats

--cross-reference-authors
Create cross-references in Authors section for books with multiple authors. Default: 'False' Applies to: AZW3, EPUB, MOBI output formats

--debug-pipeline
Save the output from different stages of the conversion pipeline to the specified directory. Useful if you are unsure at which stage of the conversion process a bug is occurring. Default: 'None' Applies to: AZW3, EPUB, MOBI output formats

--exclude-genre
Regex describing tags to exclude as genres. Default: '^[\+]|$' excludes bracketed tags, e.g. 'Project Gutenberg', and '+', the default tag for read books. Applies to: AZW3, EPUB, MOBI output formats

--exclusion-rules
Specifies the rules used to exclude books from the generated catalog. The model for an exclusion rule is either ('<rule name>', 'Tags', '<comma-separated list of tags>') or ('<rule name>', '<custom column>', '<pattern>'). For example: (('Archived books', '#status', 'Archived'),) will exclude a book with a value of 'Archived' in the custom column 'status'. When multiple rules are defined, all rules will be applied. Default: "((('Catalogs', 'Tags', 'Catalog '),)" Applies to: AZW3, EPUB, MOBI output formats

--generate-authors
Include 'Authors' section in catalog. Default: 'False' Applies to: AZW3, EPUB, MOBI output formats

--generate-descriptions
Include 'Descriptions' section in catalog. Default: 'False' Applies to: AZW3, EPUB, MOBI output formats

--generate-genres
Include 'Genres' section in catalog. Default: 'False' Applies to: AZW3, EPUB, MOBI output formats

--generate-recently-added
Include 'Recently Added' section in catalog. Default: 'False' Applies to: AZW3, EPUB, MOBI output formats

--generate-series
Include 'Series' section in catalog. Default: 'False' Applies to: AZW3, EPUB, MOBI output formats

--generate-titles
Include 'Titles' section in catalog. Default: 'False' Applies to: AZW3, EPUB, MOBI output formats

--genre-source-field
Source field for 'Genres' section. Default: 'Tags' Applies to: AZW3, EPUB, MOBI output formats

--header-note-source-field
Custom field containing note text to insert in Description header. Default: '' Applies to: AZW3, EPUB, MOBI output formats

--merge-comments-rule
#<custom field>:[beforeafter]:[TruelFalse] specifying: <custom field> Custom field containing notes to merge with Comments [beforeafter] Placement of notes with respect to Comments [TruelFalse] - A horizontal rule is inserted between notes and Comments Default: '::' Applies to: AZW3, EPUB, MOBI output formats

--output-profile
Specifies the output profile. In some cases, an output profile is required to optimize the catalog for the device. For example, 'kindle' or 'kindle_dx' creates a structured Table of Contents with Sections and Articles. Default: 'None' Applies to: AZW3, EPUB, MOBI output formats
--prefix-rules
Specifies the rules used to include prefixes indicating read books, wishlist items and other user-specified prefixes. The model for a prefix rule is ("<rule name>','<source field>','<pattern>','<prefix>'). When multiple rules are defined, the first matching rule will be used. Default: "(( 'Read books',' tags',' +','✓ '),'( 'Wishlist item',' tags',' Wishlist ',' × '))" Applies to: AZW3, EPUB, MOBI output formats

--preset
Use a named preset created with the GUI catalog builder. A preset specifies all settings for building a catalog. Default: 'None' Applies to: AZW3, EPUB, MOBI output formats

--thumb-width
Size hint (in inches) for book covers in catalog. Range: 1.0 - 2.0 Default: '1.0' Applies to: AZW3, EPUB, MOBI output formats

--use-existing-cover
Replace existing cover when generating the catalog. Default: 'False' Applies to: AZW3, EPUB, MOBI output formats

saved_searches

```
calibredb saved_searches [options] (list|add|remove)
```

Manage the saved searches stored in this database. If you try to add a query with a name that already exists, it will be replaced.

Syntax for adding:
```
calibredb saved_searches add search_name search_expression
```

Syntax for removing:
```
calibredb saved_searches remove search_name
```

Whenever you pass arguments to calibredb that have spaces in them, enclose the arguments in quotation marks. For example: "/some path/with spaces"

add_custom_column

```
calibredb add_custom_column [options] label name datatype
```

Create a custom column. label is the machine friendly name of the column. Should not contain spaces or colons. name is the human friendly name of the column. datatype is one of: bool, comments, composite, datetime, enumeration, float, int, rating, series, text

Whenever you pass arguments to calibredb that have spaces in them, enclose the arguments in quotation marks. For example: "/some path/with spaces"

--display
A dictionary of options to customize how the data in this column will be interpreted. This is a JSON string. For enumeration columns, use --display (page 286)"{"enum_values":"\"val1\",\"val2\"\"}" There are many options that can go into the display variable. The options by column type are: composite: composite_template, composite_sort, make_category,contains_html, use_decorations datetime: date_format enumeration: enum_values, enum_colors, use_decorations int, float: number_format text: is_names, use_decorations The best way to find legal combinations is to create a custom column of the appropriate type in the GUI then look at the backup OPF for a book (ensure that a new OPF has been created since the column was added). You will see the JSON for the "display" for the new column in the OPF.
**--is-multiple**
This column stores tag like data (i.e. multiple comma separated values). Only applies if datatype is text.

**custom_columns**

```
calibredb custom_columns [options]
```

List available custom columns. Shows column labels and ids.

Whenever you pass arguments to calibredb that have spaces in them, enclose the arguments in quotation marks. For example: “/some path/with spaces”

**--details, -d**
Show details for each column.

**remove_custom_column**

```
calibredb remove_custom_column [options] label
```

Remove the custom column identified by label. You can see available columns with the custom_columns command.

Whenever you pass arguments to calibredb that have spaces in them, enclose the arguments in quotation marks. For example: “/some path/with spaces”

**--force, -f**
Do not ask for confirmation

**set_custom**

```
calibredb set_custom [options] column id value
```

Set the value of a custom column for the book identified by id. You can get a list of ids using the search command. You can get a list of custom column names using the custom_columns command.

Whenever you pass arguments to calibredb that have spaces in them, enclose the arguments in quotation marks. For example: “/some path/with spaces”

**--append, -a**
If the column stores multiple values, append the specified values to the existing ones, instead of replacing them.

**restore_database**

```
calibredb restore_database [options]
```

Restore this database from the metadata stored in OPF files in each directory of the calibre library. This is useful if your metadata.db file has been corrupted.

**WARNING:** This command completely regenerates your database. You will lose all saved searches, user categories, plugboards, stored per-book conversion settings, and custom recipes. Restored metadata will only be as accurate as what is found in the OPF files.

Whenever you pass arguments to calibredb that have spaces in them, enclose the arguments in quotation marks. For example: “/some path/with spaces”
--really-do-it, -r
Really do the recovery. The command will not run unless this option is specified.

check_library

```
calibredb check_library [options]
```

Perform some checks on the filesystem representing a library. Reports are invalid_titles, extra_titles, invalid_authors, extra_authors, missing_formats, extra_formats, extra_files, missing_covers, extra_covers, failed_folders

Whenever you pass arguments to calibredb that have spaces in them, enclose the arguments in quotation marks. For example: “/some path/with spaces”

--csv, -c
Output in CSV

--ignore_extensions, -e
Comma-separated list of extensions to ignore. Default: all

--ignore_names, -n
Comma-separated list of names to ignore. Default: all

--report, -r
Comma-separated list of reports. Default: all

list_categories

```
calibredb list_categories [options]
```

Produce a report of the category information in the database. The information is the equivalent of what is shown in the tags pane.

Whenever you pass arguments to calibredb that have spaces in them, enclose the arguments in quotation marks. For example: “/some path/with spaces”

--categories, -r
Comma-separated list of category lookup names. Default: all

--csv, -c
Output in CSV

--dialect
The type of CSV file to produce. Choices: excel, excel-tab

--item_count, -i
Output only the number of items in a category instead of the counts per item within the category

--width, -w
The maximum width of a single line in the output. Defaults to detecting screen size.

backup_metadata

```
calibredb backup_metadata [options]
```

Backup the metadata stored in the database into individual OPF files in each books directory. This normally happens automatically, but you can run this command to force re-generation of the OPF files, with the –all option.
Note that there is normally no need to do this, as the OPF files are backed up automatically, every time metadata is changed.

Whenever you pass arguments to calibredb that have spaces in them, enclose the arguments in quotation marks. For example: “/some path/with spaces”

`--all`

Normally, this command only operates on books that have out of date OPF files. This option makes it operate on all books.

**clone**

```
calibredb clone path/to/new/library
```

Create a **clone** of the current library. This creates a new, empty library that has all the same custom columns, virtual libraries and other settings as the current library.

The cloned library will contain no books. If you want to create a full duplicate, including all books, then simply use your filesystem tools to copy the library folder.

Whenever you pass arguments to calibredb that have spaces in them, enclose the arguments in quotation marks. For example: “/some path/with spaces”

**embed_metadata**

```
calibredb embed_metadata [options] book_id
```

Update the metadata in the actual book files stored in the calibre library from the metadata in the calibre database. Normally, metadata is updated only when exporting files from calibre, this command is useful if you want the files to be updated in place. Note that different file formats support different amounts of metadata. You can use the special value ‘all’ for book_id to update metadata in all books. You can also specify many book ids separated by spaces and id ranges separated by hyphens. For example: calibredb **embed_metadata** 1 2 10-15 23

Whenever you pass arguments to calibredb that have spaces in them, enclose the arguments in quotation marks. For example: “/some path/with spaces”

`--only-formats, -f`

Only update metadata in files of the specified format. Specify it multiple times for multiple formats. By default, all formats are updated.

**search**

```
calibredb search [options] search expression
```

Search the library for the specified **search** term, returning a comma separated list of book ids matching the **search** expression. The output format is useful to feed into other commands that accept a list of ids as input.

The **search** expression can be anything from calibre’s powerful **search** query language, for example: author:asimov title:robot

Whenever you pass arguments to calibredb that have spaces in them, enclose the arguments in quotation marks. For example: “/some path/with spaces”

`--limit, -l`

The maximum number of results to return. Default is all results.
12.1.7  ebook-convert

```
ebook-convert input_file output_file [options]
```

Convert an e-book from one format to another.

input_file is the input and output_file is the output. Both must be specified as the first two arguments to the command. The output e-book format is guessed from the file extension of output_file. output_file can also be of the special format .EXT where EXT is the output file extension. In this case, the name of the output file is derived from the name of the input file. Note that the filenames must not start with a hyphen. Finally, if output_file has no extension, then it is treated as a directory and an “open e-book” (OEB) consisting of HTML files is written to that directory. These files are the files that would normally have been passed to the output plugin.

After specifying the input and output file you can customize the conversion by specifying various options. The available options depend on the input and output file types. To get help on them specify the input and output file and then use the -h option.

For full documentation of the conversion system see E-book conversion (page 61)

Whenever you pass arguments to ebook-convert that have spaces in them, enclose the arguments in quotation marks. For example: “/some path/with spaces”

The options and default values for the options change depending on both the input and output formats, so you should always check with:

```
ebook-convert myfile.input_format myfile.output_format -h
```

Below are the options that are common to all conversion, followed by the options specific to every input and output format.

- Look and Feel (page 292)
- Heuristic Processing (page 294)
- Search and Replace (page 295)
- Structure Detection (page 295)
- Table of Contents (page 296)
- Metadata (page 297)
- Debug (page 298)
- AZW4 Input Options (page 298)
- CHM Input Options (page 298)
- Comic Input Options (page 298)
- DJVU Input Options (page 299)
- DOX Input Options (page 299)
- EPUB Input Options (page 299)
- FB2 Input Options (page 300)
- HTLZ Input Options (page 300)
- HTML Input Options (page 300)
--help, -h
  show this help message and exit

--input-profile
  Specify the input profile. The input profile gives the conversion system information on how to interpret various
information in the input document. For example resolution dependent lengths (i.e. lengths in pixels). Choices are: cybookg3, cybook_opus, default, hanlinv3, hanlinv5, illiad, irexdr1000, irexdr800, kindle, msreader, mobipocket, nook, sony, sony300, sony900

--list-recipes
List builtin recipe names. You can create an e-book from a builtin recipe like this: ebook-convert "Recipe Name.recipe" output.epub

--output-profile
Specify the output profile. The output profile tells the conversion system how to optimize the created document for the specified device (such as by resizing images for the device screen size). In some cases, an output profile can be used to optimize the output for a particular device, but this is rarely necessary. Choices are: cybookg3, cybook_opus, default, generic_eink, generic_eink_hd, generic_eink_large, hanlinv3, hanlinv5, illiad, ipad, ipad3, irexdr1000, irexdr800, jetbook5, kindle, kindle_dx, kindle_fire, kindle_oasis, kindle_pw, kindle_pw3, kindle_voyage, kobo, msreader, mobipocket, nook, nook_color, nook_hd_plus, pocketbook_900, pocketbook_pro_912, galaxy, sony, sony300, sony900, sony-landscape, sonyt3, tablet

--version
show program s version number and exit

Look and Feel

Options to control the look and feel of the output

--asciize
Transliterate unicode characters to an ASCII representation. Use with care because this will replace unicode characters with ASCII. For instance it will replace "Михаил Горбачёв" with "Mikhail Gorbachiov". Also, note that in cases where there are multiple representations of a character (characters shared by Chinese and Japanese for instance) the representation based on the current calibre interface language will be used.

--base-font-size
The base font size in pts. All font sizes in the produced book will be rescaled based on this size. By choosing a larger size you can make the fonts in the output bigger and vice versa. By default, when the value is zero, the base font size is chosen based on the output profile you chose.

--change-justification
Change text justification. A value of "left" converts all justified text in the source to left aligned (i.e. unjustified) text. A value of "justify" converts all unjustified text to justified. A value of "original" (the default) does not change justification in the source file. Note that only some output formats support justification.

--disable-font-rescaling
Disable all rescaling of font sizes.

--embed-all-fonts
Embed every font that is referenced in the input document but not already embedded. This will search your system for the fonts, and if found, they will be embedded. Embedding will only work if the format you are converting to supports embedded fonts, such as EPUB, AZW3, DOCX or PDF. Please ensure that you have the proper license for embedding the fonts used in this document.

--embed-font-family
Embed the specified font family into the book. This specifies the "base" font used for the book. If the input document specifies its own fonts, they may override this base font. You can use the filter style information option to remove fonts from the input document. Note that font embedding only works with some output formats, principally EPUB, AZW3 and DOCX.

--expand-css
By default, calibre will use the shorthand form for various CSS properties such as margin, padding, border, etc. This option will cause it to use the full expanded form instead. Note that CSS is always expanded when
generating EPUB files with the output profile set to one of the Nook profiles as the Nook cannot handle shorthand CSS.

**--extra-css**
Either the path to a CSS stylesheet or raw CSS. This CSS will be appended to the style rules from the source file, so it can be used to override those rules.

**--filter-css**
A comma separated list of CSS properties that will be removed from all CSS style rules. This is useful if the presence of some style information prevents it from being overridden on your device. For example: font-family,color,margin-left,margin-right

**--font-size-mapping**
Mapping from CSS font names to font sizes in pts. An example setting is 12,12,14,16,18,20,22,24. These are the mappings for the sizes xx-small to xx-large, with the final size being for huge fonts. The font rescaling algorithm uses these sizes to intelligently rescale fonts. The default is to use a mapping based on the output profile you chose.

**--insert-blank-line**
Insert a blank line between paragraphs. Will not work if the source file does not use paragraphs (<p> or <div> tags).

**--insert-blank-line-size**
Set the height of the inserted blank lines (in em). The height of the lines between paragraphs will be twice the value set here.

**--keep-ligatures**
Preserve ligatures present in the input document. A ligature is a special rendering of a pair of characters like ff, fi, fl et cetera. Most readers do not have support for ligatures in their default fonts, so they are unlikely to render correctly. By default, calibre will turn a ligature into the corresponding pair of normal characters. This option will preserve them instead.

**--line-height**
The line height in pts. Controls spacing between consecutive lines of text. Only applies to elements that do not define their own line height. In most cases, the minimum line height option is more useful. By default no line height manipulation is performed.

**--linearize-tables**
Some badly designed documents use tables to control the layout of text on the page. When converted these documents often have text that runs off the page and other artifacts. This option will extract the content from the tables and present it in a linear fashion.

**--margin-bottom**
Set the bottom margin in pts. Default is 5.0. Setting this to less than zero will cause no margin to be set (the margin setting in the original document will be preserved). Note: Page oriented formats such as PDF and DOCX have their own margin settings that take precedence.

**--margin-left**
Set the left margin in pts. Default is 5.0. Setting this to less than zero will cause no margin to be set (the margin setting in the original document will be preserved). Note: Page oriented formats such as PDF and DOCX have their own margin settings that take precedence.

**--margin-right**
Set the right margin in pts. Default is 5.0. Setting this to less than zero will cause no margin to be set (the margin setting in the original document will be preserved). Note: Page oriented formats such as PDF and DOCX have their own margin settings that take precedence.

**--margin-top**
Set the top margin in pts. Default is 5.0. Setting this to less than zero will cause no margin to be set (the margin
setting in the original document will be preserved). Note: Page oriented formats such as PDF and DOCX have their own margin settings that take precedence.

--minimum-line-height
The minimum line height, as a percentage of the element's calculated font size. calibre will ensure that every element has a line height of at least this setting, irrespective of what the input document specifies. Set to zero to disable. Default is 120%. Use this setting in preference to the direct line height specification, unless you know what you are doing. For example, you can achieve "double spaced" text by setting this to 240.

--remove-paragraph-spacing
Remove spacing between paragraphs. Also sets an indent on paragraphs of 1.5em. Spacing removal will not work if the source file does not use paragraphs (<p> or <div> tags).

--remove-paragraph-spacing-indent-size
When calibre removes blank lines between paragraphs, it automatically sets a paragraph indent, to ensure that paragraphs can be easily distinguished. This option controls the width of that indent (in em). If you set this value negative, then the indent specified in the input document is used, that is, calibre does not change the indentation.

--smarten-punctuation
Convert plain quotes, dashes and ellipsis to their typographically correct equivalents. For details, see https://daringfireball.net/projects/smarty-pants

--subset-embedded-fonts
Subset all embedded fonts. Every embedded font is reduced to contain only the glyphs used in this document. This decreases the size of the font files. Useful if you are embedding a particularly large font with lots of unused glyphs.

--transform-css-rules
Path to a file containing rules to transform the CSS styles in this book. The easiest way to create such a file is to use the wizard for creating rules in the calibre GUI. Access it in the "Look & feel->Transform styles" section of the conversion dialog. Once you create the rules, you can use the "Export" button to save them to a file.

--unsmarten-punctuation
Convert fancy quotes, dashes and ellipsis to their plain equivalents.

Heuristic Processing
Modify the document text and structure using common patterns. Disabled by default. Use –enable-heuristics to enable. Individual actions can be disabled with the –disable-* options.

--disable-dehyphenate
Analyze hyphenated words throughout the document. The document itself is used as a dictionary to determine whether hyphens should be retained or removed.

--disable-delete-blank-paragraphs
Remove empty paragraphs from the document when they exist between every other paragraph

--disable-fix-indents
Turn indentation created from multiple non-breaking space entities into CSS indents.

--disable-format-scene-breaks
Left aligned scene break markers are center aligned. Replace soft scene breaks that use multiple blank lines with horizontal rules.

--disable-italicize-common-cases
Look for common words and patterns that denote italics and italicize them.

--disable-markup-chapter-headings
Detect unformatted chapter headings and sub headings. Change them to h2 and h3 tags. This setting will not create a TOC, but can be used in conjunction with structure detection to create one.
--disable-renumber-headings
Looks for occurrences of sequential <h1> or <h2> tags. The tags are renumbered to prevent splitting in the middle of chapter headings.

--disable-unwrap-lines
Unwrap lines using punctuation and other formatting clues.

--enable-heuristics
Enable heuristic processing. This option must be set for any heuristic processing to take place.

--html-unwrap-factor
Scale used to determine the length at which a line should be unwrapped. Valid values are a decimal between 0 and 1. The default is 0.4, just below the median line length. If only a few lines in the document require unwrapping this value should be reduced.

--replace-scene-breaks
Replace scene breaks with the specified text. By default, the text from the input document is used.

Search and Replace

Modify the document text and structure using user defined patterns.

--search-replace
Path to a file containing search and replace regular expressions. The file must contain alternating lines of regular expression followed by replacement pattern (which can be an empty line). The regular expression must be in the Python regex syntax and the file must be UTF-8 encoded.

--sr1-replace
Replacement to replace the text found with sr1-search.

--sr1-search
Search pattern (regular expression) to be replaced with sr1-replace.

--sr2-replace
Replacement to replace the text found with sr2-search.

--sr2-search
Search pattern (regular expression) to be replaced with sr2-replace.

--sr3-replace
Replacement to replace the text found with sr3-search.

--sr3-search
Search pattern (regular expression) to be replaced with sr3-replace.

Structure Detection

Control auto-detection of document structure.

--chapter
An XPath expression to detect chapter titles. The default is to consider <h1> or <h2> tags that contain the words "chapter", "book", "section", "prologue", "epilogue" or "part" as chapter titles as well as any tags that have class="chapter". The expression used must evaluate to a list of elements. To disable chapter detection, use the expression "/"/. See the XPath Tutorial in the calibre User Manual for further help on using this feature.

--chapter-mark
Specify how to mark detected chapters. A value of "pagebreak" will insert page breaks before chapters. A value of "rule" will insert a line before chapters. A value of "none" will disable chapter marking and a value of "both" will use both page breaks and lines to mark chapters.
--disable-remove-fake-margins
Some documents specify page margins by specifying a left and right margin on each individual paragraph. calibre will try to detect and remove these margins. Sometimes, this can cause the removal of margins that should not have been removed. In this case you can disable the removal.

--insert-metadata
Insert the book metadata at the start of the book. This is useful if your e-book reader does not support displaying/searching metadata directly.

--page-breaks-before
An XPath expression. Page breaks are inserted before the specified elements. To disable use the expression: /

--prefer-metadata-cover
Use the cover detected from the source file in preference to the specified cover.

--remove-first-image
Remove the first image from the input e-book. Useful if the input document has a cover image that is not identified as a cover. In this case, if you set a cover in calibre, the output document will end up with two cover images if you do not specify this option.

--start-reading-at
An XPath expression to detect the location in the document at which to start reading. Some e-book reading programs (most prominently the Kindle) use this location as the position at which to open the book. See the XPath tutorial in the calibre User Manual for further help using this feature.

Table of Contents

Control the automatic generation of a Table of Contents. By default, if the source file has a Table of Contents, it will be used in preference to the automatically generated one.

--duplicate-links-in-toc
When creating a TOC from links in the input document, allow duplicate entries, i.e. allow more than one entry with the same text, provided that they point to a different location.

--level1-toc
XPath expression that specifies all tags that should be added to the Table of Contents at level one. If this is specified, it takes precedence over other forms of auto-detection. See the XPath Tutorial in the calibre User Manual for examples.

--level2-toc
XPath expression that specifies all tags that should be added to the Table of Contents at level two. Each entry is added under the previous level one entry. See the XPath Tutorial in the calibre User Manual for examples.

--level3-toc
XPath expression that specifies all tags that should be added to the Table of Contents at level three. Each entry is added under the previous level two entry. See the XPath Tutorial in the calibre User Manual for examples.

--max-toc-links
Maximum number of links to insert into the TOC. Set to 0 to disable. Default is: 50. Links are only added to the TOC if less than the threshold number of chapters were detected.

--no-chapters-in-toc
Don’t add auto-detected chapters to the Table of Contents.

--toc-filter
Remove entries from the Table of Contents whose titles match the specified regular expression. Matching entries and all their children are removed.

--toc-threshold
If fewer than this number of chapters is detected, then links are added to the Table of Contents. Default: 6
--use-auto-toc

Normally, if the source file already has a Table of Contents, it is used in preference to the auto-generated one. With this option, the auto-generated one is always used.

Metadata

Options to set metadata in the output

--author-sort
String to be used when sorting by author.

--authors
Set the authors. Multiple authors should be separated by ampersands.

--book-producer
Set the book producer.

--comments
Set the e-book description.

--cover
Set the cover to the specified file or URL

--isbn
Set the ISBN of the book.

--language
Set the language.

--pubdate
Set the publication date (assumed to be in the local timezone, unless the timezone is explicitly specified)

--publisher
Set the e-book publisher.

--rating
Set the rating. Should be a number between 1 and 5.

--read-metadata-from-opf, --from-opf, -m
Read metadata from the specified OPF file. Metadata read from this file will override any metadata in the source file.

--series
Set the series this e-book belongs to.

--series-index
Set the index of the book in this series.

--tags
Set the tags for the book. Should be a comma separated list.

--timestamp
Set the book timestamp (no longer used anywhere)

--title
Set the title.

--title-sort
The version of the title to be used for sorting.
Debug

Options to help with debugging the conversion

`--debug-pipeline, -d`
Save the output from different stages of the conversion pipeline to the specified directory. Useful if you are unsure at which stage of the conversion process a bug is occurring.

`--verbose, -v`
Level of verbosity. Specify multiple times for greater verbosity. Specifying it twice will result in full verbosity, once medium verbosity and zero times least verbosity.

AZW4 Input Options

`--input-encoding`
Specify the character encoding of the input document. If set this option will override any encoding declared by the document itself. Particularly useful for documents that do not declare an encoding or that have erroneous encoding declarations.

CHM Input Options

`--input-encoding`
Specify the character encoding of the input document. If set this option will override any encoding declared by the document itself. Particularly useful for documents that do not declare an encoding or that have erroneous encoding declarations.

Comic Input Options

`--colors`
Reduce the number of colors used in the image. This works only if you choose the PNG output format. It is useful to reduce file sizes. Set to zero to turn off. Maximum value is 256. It is off by default.

`--comic-image-size`
Specify the image size as widthxheight pixels. Normally, an image size is automatically calculated from the output profile, this option overrides it.

`--despeckle`
Enable Despeckle. Reduces speckle noise. May greatly increase processing time.

`--disable-trim`
Disable trimming of comic pages. For some comics, trimming might remove content as well as borders.

`--dont-add-comic-pages-to-toc`
When converting a CBC do not add links to each page to the TOC. Note this only applies if the TOC has more than one section.

`--dont-grayscale`
Do not convert the image to grayscale (black and white)

`--dont-normalize`
Disable normalize (improve contrast) color range for pictures. Default: False

`--dont-sharpen`
Disable sharpening.
--input-encoding
Specify the character encoding of the input document. If set this option will override any encoding declared by
the document itself. Particularly useful for documents that do not declare an encoding or that have erroneous
encoding declarations.

--keep-aspect-ratio
Maintain picture aspect ratio. Default is to fill the screen.

--landscape
Don't split landscape images into two portrait images

--no-process
Apply no processing to the image

--no-sort
Don't sort the files found in the comic alphabetically by name. Instead use the order they were added to the
comic.

--output-format
The format that images in the created e-book are converted to. You can experiment to see which format gives
you optimal size and look on your device.

--right2left
Used for right-to-left publications like manga. Causes landscape pages to be split into portrait pages from right
to left.

--wide
Keep aspect ratio and scale image using screen height as image width for viewing in landscape mode.

DJVU Input Options

--input-encoding
Specify the character encoding of the input document. If set this option will override any encoding declared by
the document itself. Particularly useful for documents that do not declare an encoding or that have erroneous
encoding declarations.

DOCX Input Options

--docx-inline-subsup
Render superscripts and subscripts so that they do not affect the line height.

--docx-no-cover
Normally, if a large image is present at the start of the document that looks like a cover, it will be removed from
the document and used as the cover for created e-book. This option turns off that behavior.

--docx-no-pagebreaks-between-notes
Do not insert a page break after every endnote.

--input-encoding
Specify the character encoding of the input document. If set this option will override any encoding declared by
the document itself. Particularly useful for documents that do not declare an encoding or that have erroneous
encoding declarations.

EPUB Input Options

--input-encoding
Specify the character encoding of the input document. If set this option will override any encoding declared by
the document itself. Particularly useful for documents that do not declare an encoding or that have erroneous encoding declarations.

**FB2 Input Options**

--input-encoding
Specify the character encoding of the input document. If set this option will override any encoding declared by the document itself. Particularly useful for documents that do not declare an encoding or that have erroneous encoding declarations.

--no-inline-fb2-toc
Do not insert a Table of Contents at the beginning of the book.

**HTLZ Input Options**

--input-encoding
Specify the character encoding of the input document. If set this option will override any encoding declared by the document itself. Particularly useful for documents that do not declare an encoding or that have erroneous encoding declarations.

**HTML Input Options**

--breadth-first
Traverse links in HTML files breadth first. Normally, they are traversed depth first.

--dont-package
Normally this input plugin re-arranges all the input files into a standard folder hierarchy. Only use this option if you know what you are doing as it can result in various nasty side effects in the rest of the conversion pipeline.

--input-encoding
Specify the character encoding of the input document. If set this option will override any encoding declared by the document itself. Particularly useful for documents that do not declare an encoding or that have erroneous encoding declarations.

--max-levels
Maximum levels of recursion when following links in HTML files. Must be non-negative. 0 implies that no links in the root HTML file are followed. Default is 5.

**LIT Input Options**

--input-encoding
Specify the character encoding of the input document. If set this option will override any encoding declared by the document itself. Particularly useful for documents that do not declare an encoding or that have erroneous encoding declarations.

**LRF Input Options**

--input-encoding
Specify the character encoding of the input document. If set this option will override any encoding declared by the document itself. Particularly useful for documents that do not declare an encoding or that have erroneous encoding declarations.
MOBI Input Options

--input-encoding
Specify the character encoding of the input document. If set this option will override any encoding declared by the document itself. Particularly useful for documents that do not declare an encoding or that have erroneous encoding declarations.

ODT Input Options

--input-encoding
Specify the character encoding of the input document. If set this option will override any encoding declared by the document itself. Particularly useful for documents that do not declare an encoding or that have erroneous encoding declarations.

PDB Input Options

--input-encoding
Specify the character encoding of the input document. If set this option will override any encoding declared by the document itself. Particularly useful for documents that do not declare an encoding or that have erroneous encoding declarations.

PDF Input Options

--input-encoding
Specify the character encoding of the input document. If set this option will override any encoding declared by the document itself. Particularly useful for documents that do not declare an encoding or that have erroneous encoding declarations.

--new-pdfe-engine
Use the new PDF conversion engine. Currently not operational.

--no-images
Do not extract images from the document

--unwrap-factor
Scale used to determine the length at which a line should be unwrapped. Valid values are a decimal between 0 and 1. The default is 0.45, just below the median line length.

PML Input Options

--input-encoding
Specify the character encoding of the input document. If set this option will override any encoding declared by the document itself. Particularly useful for documents that do not declare an encoding or that have erroneous encoding declarations.

RB Input Options

--input-encoding
Specify the character encoding of the input document. If set this option will override any encoding declared by the document itself. Particularly useful for documents that do not declare an encoding or that have erroneous encoding declarations.
RTF Input Options

--ignore-wmf
Ignore WMF images instead of replacing them with a placeholder image.

--input-encoding
Specify the character encoding of the input document. If set this option will override any encoding declared by the document itself. Particularly useful for documents that do not declare an encoding or that have erroneous encoding declarations.

Recipe Input Options

--dont-download-recipe
Do not download latest version of builtin recipes from the calibre server

--input-encoding
Specify the character encoding of the input document. If set this option will override any encoding declared by the document itself. Particularly useful for documents that do not declare an encoding or that have erroneous encoding declarations.

--lrf
Optimize fetching for subsequent conversion to LRF.

--password
Password for sites that require a login to access content.

--test
Useful for recipe development. Forces max_articles_per_feed to 2 and downloads at most 2 feeds. You can change the number of feeds and articles by supplying optional arguments. For example: --test (page 302) 3 1 will download at most 3 feeds and only 1 article per feed.

--username
Username for sites that require a login to access content.

SNB Input Options

--input-encoding
Specify the character encoding of the input document. If set this option will override any encoding declared by the document itself. Particularly useful for documents that do not declare an encoding or that have erroneous encoding declarations.

TCR Input Options

--input-encoding
Specify the character encoding of the input document. If set this option will override any encoding declared by the document itself. Particularly useful for documents that do not declare an encoding or that have erroneous encoding declarations.

TXT Input Options

--formatting-type
Formatting used within the document. * auto: Automatically decide which formatting processor to use * plain: No formatting * heuristic: Use heuristics to determine chapter headings, italics, etc. * textile: Use the TexTile
markup language * markdown: Use the Markdown markup language To learn more about markdown see https://daringfireball.net/projects/markdown/

```
--input-encoding
```
Specify the character encoding of the input document. If set this option will override any encoding declared by the document itself. Particularly useful for documents that do not declare an encoding or that have erroneous encoding declarations.

```
--markdown-extensions
```
Enable extensions to markdown syntax. Extensions are formatting that is not part of the standard markdown format. The extensions enabled by default: footnotes, tables, toc. To learn more about markdown extensions, see https://python-markdown.github.io/extensions/ This should be a comma separated list of extensions to enable:
* abbr: Abbreviations * admonition: Support admonitions * attr_list: Add attribute to HTML tags * def_list: Definition lists * extra: Enables various common extensions * fenced_code: Alternative code block syntax * footnotes: Footnotes * headerid: Allow ids as part of a header * meta: Metadata in the document * tables: Support tables * toc: Generate a table of contents * wikilinks: Wiki style links

```
--paragraph-type
```
Paragraph structure to assume. The value of "off" is useful for formatted documents such as Markdown or Textile. Choices are: * auto: Try to auto detect paragraph type * block: Treat a blank line as a paragraph break * single: Assume every line is a paragraph * print: Assume every line starting with 2+ spaces or a tab starts a paragraph * unformatted: Most lines have hard line breaks, few/no blank lines or indents * off: Don’t modify the paragraph structure

```
--preserve-spaces
```
Normally extra spaces are condensed into a single space. With this option all spaces will be displayed.

```
--txt-in-remove-indents
```
Normally extra space at the beginning of lines is retained. With this option they will be removed.

### AZW3 Output Options

```
--dont-compress
```
Disable compression of the file contents.

```
--extract-to
```
Extract the contents of the generated AZW3 file to the specified directory. The contents of the directory are first deleted, so be careful.

```
--mobi-toc-at-start
```
When adding the Table of Contents to the book, add it at the start of the book instead of the end. Not recommended.

```
--no-inline-toc
```
Don’t add Table of Contents to the book. Useful if the book has its own table of contents.

```
--prefer-author-sort
```
When present, use author sort field as author.

```
--pretty-print
```
If specified, the output plugin will try to create output that is as human readable as possible. May not have any effect for some output plugins.

```
--share-not-sync
```
Enable sharing of book content via Facebook etc. on the Kindle. WARNING: Using this feature means that the book will not auto sync its last read position on multiple devices. Complain to Amazon.

```
--toc-title
```
Title for any generated in-line table of contents.
DOCX Output Options

`--docx-custom-page-size`
Custom size of the document. Use the form widthxheight EG. 123x321 to specify the width and height (in pts).
This overrides any specified page-size.

`--docx-no-cover`
Do not insert the book cover as an image at the start of the document. If you use this option, the book cover will be discarded.

`--docx-no-toc`
Do not insert the table of contents as a page at the start of the document.

`--docx-page-margin-bottom`
The size of the bottom page margin, in pts. Default is 72pt. Overrides the common bottom page margin setting, unless set to zero.

`--docx-page-margin-left`
The size of the left page margin, in pts. Default is 72pt. Overrides the common left page margin setting.

`--docx-page-margin-right`
The size of the right page margin, in pts. Default is 72pt. Overrides the common right page margin setting, unless set to zero.

`--docx-page-margin-top`
The size of the top page margin, in pts. Default is 72pt. Overrides the common top page margin setting, unless set to zero.

`--docx-page-size`
The size of the page. Default is letter. Choices are ['a0', 'a1', 'a2', 'a3', 'a4', 'a5', 'a6', 'b0', 'b1', 'b2', 'b3', 'b4', 'b5', 'b6', 'legal', 'letter']

`--extract-to`
Extract the contents of the generated DOCX file to the specified directory. The contents of the directory are first deleted, so be careful.

`--preserve-cover-aspect-ratio`
Preserve the aspect ratio of the cover image instead of stretching it out to cover the entire page.

`--pretty-print`
If specified, the output plugin will try to create output that is as human readable as possible. May not have any effect for some output plugins.

EPUB Output Options

`--dont-split-on-page-breaks`
Turn off splitting at page breaks. Normally, input files are automatically split at every page break into two files. This gives an output e-book that can be parsed faster and with less resources. However, splitting is slow and if your source file contains a very large number of page breaks, you should turn off splitting on page breaks.

`--epub-flatten`
This option is needed only if you intend to use the EPUB with FBReaderJ. It will flatten the file system inside the EPUB, putting all files into the top level.

`--epub-inline-toc`
Insert an inline Table of Contents that will appear as part of the main book content.

`--epub-toc-at-end`
Put the inserted inline Table of Contents at the end of the book instead of the start.
--epub-version
The version of the EPUB file to generate. EPUB 2 is the most widely compatible, only use EPUB 3 if you know
you actually need it.

--extract-to
Extract the contents of the generated EPUB file to the specified directory. The contents of the directory are first
deleted, so be careful.

--flow-size
Split all HTML files larger than this size (in KB). This is necessary as most EPUB readers cannot handle large
file sizes. The default of 260KB is the size required for Adobe Digital Editions. Set to 0 to disable size based
splitting.

--no-default-epub-cover
Normally, if the input file has no cover and you don’t specify one, a default cover is generated with the title,
authors, etc. This option disables the generation of this cover.

--no-svg-cover
Do not use SVG for the book cover. Use this option if your EPUB is going to be used on a device that does not
support SVG, like the iPhone or the JetBook Lite. Without this option, such devices will display the cover as a
blank page.

--preserve-cover-aspect-ratio
When using an SVG cover, this option will cause the cover to scale to cover the available screen area, but still
preserve its aspect ratio (ratio of width to height). That means there may be white borders at the sides or top
and bottom of the image, but the image will never be distorted. Without this option the image may be slightly
distorted, but there will be no borders.

--pretty-print
If specified, the output plugin will try to create output that is as human readable as possible. May not have any
effect for some output plugins.

--toc-title
Title for any generated in-line table of contents.

FB2 Output Options

--fb2-genre
Genre for the book. Choices: sf_history, sf_action, sf_epic, sf_heroic, sf_detective, sf_cyberpunk, sf_space,
sf_social, sf_horror, sf_humor, sf_fantasy, sf, det_classic, det_police, det_action, det_irony, det_history,
det_espionage, det_criminal, det_political, det_maniac, det_hard, thriller, detective, prose_classic, prose_history,
prose_contemporary, prose_counter, prose_rus_classic, prose_su_classics, love_contemporary, love_history,
love_detective, love_short, love_erotic, adv_western, adv_history, adv_powder, adv_indian, adv_maritime, adv_geo,
adv_animal, adventure, child_tale, child_verse, child_prose, child_sf, child_det, child_adv, child_education,
children, poetry, dramaturgy, antique_ant, antique_european, antique_russian, antique_east, antique_myths,
antique, sci_history, sci_psychology, sci_culture, sci_religion, sci_philosophy, sci_politics, sci_business, sci_juris,
sci_linguistic, sci_medicine, sci_phys, sci_chemistry, sci_biology, sci_tech, science, comp_www,
comp_programming, comp_hard, comp_soft, comp_db, comp_osnet, computers, ref_encyc, ref_dict, ref_ref,
ref_guide, reference, nonf_bibliography, nonf_publicism, nonf_criticism, design, nonfiction, religion_rel, religion_esoteries,
religion_self, religion, humor_anecdote, humor_prose, humor_verse, humor, home_cooking,
home_pets, home_crafts, home_entertain, home_health, home_garden, home_diy, home_sport, home_sex,
home See: http://www.fictionbook.org/index.php/Eng:FictionBook_2.1_genres for a complete list with descrip-
tions.

--pretty-print
If specified, the output plugin will try to create output that is as human readable as possible. May not have any
effect for some output plugins.
--sectionize
Specify how sections are created: * nothing: A single section * files: Section per file * toc: Section per entry in the ToC If ToC based generation fails, adjust the "Structure detection" and/or "Table of Contents" settings (turn on "Force use of auto-generated Table of Contents").

**HTML Output Options**

--extract-to
Extract the contents of the generated ZIP file to the specified directory. WARNING: The contents of the directory will be deleted.

--pretty-print
If specified, the output plugin will try to create output that is as human readable as possible. May not have any effect for some output plugins.

--template-css
CSS file used for the output instead of the default file

--template-html
Template used for the generation of the HTML contents of the book instead of the default file

--template-html-index
Template used for generation of the HTML index file instead of the default file

**HTMLZ Output Options**

--htmlz-class-style
How to handle the CSS when using css-type = 'class'. Default is external. external: Use an external CSS file inline: Use a <style> tag in the HTML file

--htmlz-css-type
Specify the handling of CSS. Default is class. class: Use CSS classes inline: Use the style attribute tag: Use HTML tags wherever possible

--htmlz-title-filename
If set this option causes the file name of the HTML file inside the HTMLZ archive to be based on the book title.

--pretty-print
If specified, the output plugin will try to create output that is as human readable as possible. May not have any effect for some output plugins.

**LIT Output Options**

--pretty-print
If specified, the output plugin will try to create output that is as human readable as possible. May not have any effect for some output plugins.

**LRF Output Options**

--enable-autorotation
Enable auto-rotation of images that are wider than the screen width.

--header
Add a header to all the pages with title and author.
--header-format
Set the format of the header. %a is replaced by the author and %t by the title. Default is %t by %a

--header-separation
Add extra spacing below the header. Default is 0 pt.

--minimum-indent
Minimum paragraph indent (the indent of the first line of a paragraph) in pts. Default: 0

--mono-family
The monospace family of fonts to embed

--pretty-print
If specified, the output plugin will try to create output that is as human readable as possible. May not have any
effect for some output plugins.

--render-tables-as-images
Render tables in the HTML as images (useful if the document has large or complex tables)

--sans-family
The sans-serif family of fonts to embed

--serif-family
The serif family of fonts to embed

--text-size-multiplier-for-rendered-tables
Multiply the size of text in rendered tables by this factor. Default is 1.0

--wordspace
Set the space between words in pts. Default is 2.5

MOBI Output Options

--dont-compress
Disable compression of the file contents.

--extract-to
Extract the contents of the generated MOBI file to the specified directory. The contents of the directory are first
deleted, so be careful.

--mobi-file-type
By default calibre generates MOBI files that contain the old MOBI 6 format. This format is compatible with all
devices. However, by changing this setting, you can tell calibre to generate MOBI files that contain both MOBI
6 and the new KF8 format, or only the new KF8 format. KF8 has more features than MOBI 6, but only works
with newer Kindles. Allowed values: old, both, new

--mobi-ignore-margins
Ignore margins in the input document. If False, then the MOBI output plugin will try to convert margins specified
in the input document, otherwise it will ignore them.

--mobi-keep-original-images
By default calibre converts all images to JPEG format in the output MOBI file. This is for maximum compat-
ibility as some older MOBI viewers have problems with other image formats. This option tells calibre not to
do this. Useful if your document contains lots of GIF/PNG images that become very large when converted to
JPEG.

--mobi-toc-at-start
When adding the Table of Contents to the book, add it at the start of the book instead of the end. Not recom-
manded.
--no-inline-toc
Don't add Table of Contents to the book. Useful if the book has its own table of contents.

--personal-doc
Tag for MOBI files to be marked as personal documents. This option has no effect on the conversion. It is used only when sending MOBI files to a device. If the file being sent has the specified tag, it will be marked as a personal document when sent to the Kindle.

--prefer-author-sort
When present, use author sort field as author.

--pretty-print
If specified, the output plugin will try to create output that is as human readable as possible. May not have any effect for some output plugins.

--share-not-sync
Enable sharing of book content via Facebook etc. on the Kindle. WARNING: Using this feature means that the book will not auto sync its last read position on multiple devices. Complain to Amazon.

--toc-title
Title for any generated in-line table of contents.

OEB Output Options

--pretty-print
If specified, the output plugin will try to create output that is as human readable as possible. May not have any effect for some output plugins.

PDB Output Options

--format, -f
Format to use inside the pdb container. Choices are: ['doc', 'ereader', 'ztxt']

--inline-toc
Add Table of Contents to beginning of the book.

--pdb-output-encoding
Specify the character encoding of the output document. The default is cp1252. Note: This option is not honored by all formats.

--pretty-print
If specified, the output plugin will try to create output that is as human readable as possible. May not have any effect for some output plugins.

PDF Output Options

--custom-size
Custom size of the document. Use the form widthxheight e.g. 123x321 to specify the width and height. This overrides any specified paper-size.

--paper-size
The size of the paper. This size will be overridden when a non default output profile is used. Default is letter. Choices are ['u'a0', 'u'a1', 'u'a2', 'u'a3', 'u'a4', 'u'a5', 'u'a6', 'u'b0', 'u'b1', 'u'b2', 'u'b3', 'u'b4', 'u'b5', 'u'b6', 'u'legal', 'u'letter']
--pdf-add-toc
  Add a Table of Contents at the end of the PDF that lists page numbers. Useful if you want to print out the PDF. If this PDF is intended for electronic use, use the PDF Outline instead.

--pdf-default-font-size
  The default font size

--pdf-footer-template
  An HTML template used to generate footers on every page. The strings _PAGENUM_, _TITLE_, _AUTHOR_ and _SECTION_ will be replaced by their current values.

--pdf-header-template
  An HTML template used to generate headers on every page. The strings _PAGENUM_, _TITLE_, _AUTHOR_ and _SECTION_ will be replaced by their current values.

--pdf-hyphenate
  Break long words at the end of lines. This can give the text at the right margin a more even appearance.

--pdf-mark-links
  Surround all links with a red box, useful for debugging.

--pdf-mono-family
  The font family used to render monospace fonts

--pdf-mono-font-size
  The default font size for monospaced text

--pdf-page-margin-bottom
  The size of the bottom page margin, in pts. Default is 72pt. Overrides the common bottom page margin setting, unless set to zero.

--pdf-page-margin-left
  The size of the left page margin, in pts. Default is 72pt. Overrides the common left page margin setting.

--pdf-page-margin-right
  The size of the right page margin, in pts. Default is 72pt. Overrides the common right page margin setting, unless set to zero.

--pdf-page-margin-top
  The size of the top page margin, in pts. Default is 72pt. Overrides the common top page margin setting, unless set to zero.

--pdf-page-number-map
  Adjust page numbers, as needed. Syntax is a JavaScript expression for the page number. For example, "if (n < 3) 0; else n - 3;", where n is current page number.

--pdf-page-numbers
  Add page numbers to the bottom of every page in the generated PDF file. If you specify a footer template, it will take precedence over this option.

--pdf-sans-family
  The font family used to render sans-serif fonts

--pdf-serif-family
  The font family used to render serif fonts

--pdf-standard-font
  The font family used to render monospace fonts

--pdf-use-document-margins
  Use the page margins specified in the input document via @page CSS rules. This will cause the margins
specified in the conversion settings to be ignored. If the document does not specify page margins, the conversion 
settings will be used as a fallback.

--preserve-cover-aspect-ratio
Preserve the aspect ratio of the cover, instead of stretching it to fill the full first page of the generated pdf.

--pretty-print
If specified, the output plugin will try to create output that is as human readable as possible. May not have any 
effect for some output plugins.

--toc-title
Title for generated table of contents.

--uncompressed-pdf
Generate an uncompressed PDF, useful for debugging, only works with the new PDF engine.

--unit, -u
The unit of measure for page sizes. Default is inch. Choices are ['millimeter', 'centimeter', 'point', 'inch', 
pica', 'didot', 'cicero', 'devicepixel'] Note: This does not override the unit for margins!

--use-profile-size
Instead of using the paper size specified in the PDF Output options, use a paper size corresponding to the current 
output profile. Useful if you want to generate a PDF for viewing on a specific device.

PML Output Options

--full-image-depth
Do not reduce the size or bit depth of images. Images have their size and depth reduced by default to accommo-
date applications that can not convert images on their own such as Dropbook.

--inline-toc
Add Table of Contents to beginning of the book.

--pml-output-encoding
Specify the character encoding of the output document. The default is cp1252.

--pretty-print
If specified, the output plugin will try to create output that is as human readable as possible. May not have any 
effect for some output plugins.

RB Output Options

--inline-toc
Add Table of Contents to beginning of the book.

--pretty-print
If specified, the output plugin will try to create output that is as human readable as possible. May not have any 
effect for some output plugins.

RTF Output Options

--pretty-print
If specified, the output plugin will try to create output that is as human readable as possible. May not have any 
effect for some output plugins.
SNB Output Options

**--pretty-print**
If specified, the output plugin will try to create output that is as human readable as possible. May not have any effect for some output plugins.

**--snb-dont-indent-first-line**
Specify whether or not to insert two space characters to indent the first line of each paragraph.

**--snb-full-screen**
Resize all the images for full screen view.

**--snb-hide-chapter-name**
Specify whether or not to hide the chapter title for each chapter. Useful for image-only output (e.g., comics).

**--snb-insert-empty-line**
Specify whether or not to insert an empty line between two paragraphs.

**--snb-max-line-length**
The maximum number of characters per line. This splits on the first space before the specified value. If no space is found the line will be broken at the space after and will exceed the specified value. Also, there is a minimum of 25 characters. Use 0 to disable line splitting.

**--snb-output-encoding**
Specify the character encoding of the output document. The default is utf-8.

TCR Output Options

**--pretty-print**
If specified, the output plugin will try to create output that is as human readable as possible. May not have any effect for some output plugins.

**--tcr-output-encoding**
Specify the character encoding of the output document. The default is utf-8.

TXT Output Options

**--force-max-line-length**
Force splitting on the max-line-length value when no space is present. Also allows max-line-length to be below the minimum

**--inline-toc**
Add Table of Contents to beginning of the book.

**--keep-color**
Do not remove font color from output. This is only useful when txt-output-formatting is set to textile. Textile is the only formatting that supports setting font color. If this option is not specified font color will not be set and default to the color displayed by the reader (generally this is black).

**--keep-image-references**
Do not remove image references within the document. This is only useful when paired with a txt-output-formatting option that is not none because links are always removed with plain text output.

**--keep-links**
Do not remove links within the document. This is only useful when paired with a txt-output-formatting option that is not none because links are always removed with plain text output.
calibre User Manual, Release 3.33.1

--max-line-length
The maximum number of characters per line. This splits on the first space before the specified value. If no space is found the line will be broken at the space after and will exceed the specified value. Also, there is a minimum of 25 characters. Use 0 to disable line splitting.

--newline, -n
Type of newline to use. Options are ['old_mac', 'system', 'unix', 'windows']. Default is 'system'. Use 'old_mac' for compatibility with Mac OS 9 and earlier. For macOS use 'unix'. 'system' will default to the newline type used by this OS.

--pretty-print
If specified, the output plugin will try to create output that is as human readable as possible. May not have any effect for some output plugins.

--txt-output-encoding
Specify the character encoding of the output document. The default is utf-8.

--txt-output-formatting
Formatting used within the document. * plain: Plain text * markdown: Markdown formatted text * textile: TexTile formatted text

TXTZ Output Options

--force-max-line-length
Force splitting on the max-line-length value when no space is present. Also allows max-line-length to be below the minimum

--inline-toc
Add Table of Contents to beginning of the book.

--keep-color
Do not remove font color from output. This is only useful when txt-output-formatting is set to textile. Textile is the only formatting that supports setting font color. If this option is not specified font color will not be set and default to the color displayed by the reader (generally this is black).

--keep-image-references
Do not remove image references within the document. This is only useful when paired with a txt-output-formatting option that is not none because links are always removed with plain text output.

--keep-links
Do not remove links within the document. This is only useful when paired with a txt-output-formatting option that is not none because links are always removed with plain text output.

--max-line-length
The maximum number of characters per line. This splits on the first space before the specified value. If no space is found the line will be broken at the space after and will exceed the specified value. Also, there is a minimum of 25 characters. Use 0 to disable line splitting.

--newline, -n
Type of newline to use. Options are ['old_mac', 'system', 'unix', 'windows']. Default is 'system'. Use 'old_mac' for compatibility with Mac OS 9 and earlier. For macOS use 'unix'. 'system' will default to the newline type used by this OS.

--pretty-print
If specified, the output plugin will try to create output that is as human readable as possible. May not have any effect for some output plugins.

--txt-output-encoding
Specify the character encoding of the output document. The default is utf-8.
12.1.8 ebook-edit

```
ebook-edit [opts] [path_to_ebook] [name_of_file_inside_book ...]
```

Launch the calibre edit book tool. You can optionally also specify the names of files inside the book which will be opened for editing automatically.

Whenever you pass arguments to `ebook-edit` that have spaces in them, enclose the arguments in quotation marks. For example: “/some path/with spaces”

**[options]**

`--detach`
- Detach from the controlling terminal, if any (Linux only)

`--help, -h`
- Show this help message and exit

`--version`
- Show program’s version number and exit

12.1.9 ebook-meta

```
ebook-meta ebook_file [options]
```

Read/Write metadata from/to e-book files.

Supported formats for reading metadata: azw, azw1, azw3, azw4, cbr, cbz, chm, docx, epub, fb2, fbz, html, htmlz, imp, lit, lrf, lrx, mobi, odt, oebzip, opf, pdb, pdf, pml, pmlz, pobi, prc, rar, rb, rtf, snb, tpz, txt, txtz, updb, zip

Supported formats for writing metadata: azw, azw1, azw3, azw4, docx, epub, fb2, fbz, htmlz, lrf, mobi, pdb, pdf, prc, rtf, tpz, txtz

Different file types support different kinds of metadata. If you try to set some metadata on a file type that does not support it, the metadata will be silently ignored.

Whenever you pass arguments to `ebook-meta` that have spaces in them, enclose the arguments in quotation marks. For example: “/some path/with spaces”

**[options]**

`--author-sort`
- String to be used when sorting by author. If unspecified, and the author(s) are specified, it will be auto-generated from the author(s).

`--authors, -a`
- Set the authors. Multiple authors should be separated by the & character. Author names should be in the order Firstname Lastname.

`--book-producer, -k`
- Set the book producer.
--category
    Set the book category.

--comments, -c
    Set the e-book description.

--cover
    Set the cover to the specified file.

--date, -d
    Set the published date.

--from-opf
    Read metadata from the specified OPF file and use it to set metadata in the e-book. Metadata specified on the
    command line will override metadata read from the OPF file

--get-cover
    Get the cover from the e-book and save it at as the specified file.

--help, -h
    show this help message and exit

--identifier
    Set the identifiers for the book, can be specified multiple times. For example: --identifier (page 314)
    uri:http://acme.com --identifier (page 314) isbn:12345 To remove an identifier, specify no value,
    --identifier (page 314) isbn: Note that for EPUB files, an identifier marked as the package identifier
    cannot be removed.

--index, -i
    Set the index of the book in this series.

--isbn
    Set the ISBN of the book.

--language, -l
    Set the language.

--lrf-bookid
    Set the BookID in LRF files

--publisher, -p
    Set the e-book publisher.

--rating, -r
    Set the rating. Should be a number between 1 and 5.

--series, -s
    Set the series this e-book belongs to.

--tags
    Set the tags for the book. Should be a comma separated list.

--title, -t
    Set the title.

--title-sort
    The version of the title to be used for sorting. If unspecified, and the title is specified, it will be auto-generated
    from the title.

--to-opf
    Specify the name of an OPF file. The metadata will be written to the OPF file.
12.110 ebook-polish

Polishing books is all about putting the shine of perfection onto your carefully crafted e-books.

Polishing tries to minimize the changes to the internal code of your e-book. Unlike conversion, it does not flatten CSS, rename files, change font sizes, adjust margins, etc. Every action performs only the minimum set of changes needed for the desired effect.

You should use this tool as the last step in your e-book creation process.

Note that polishing only works on files in the AZW3 or EPUB formats.

Whenever you pass arguments to ebook-polish that have spaces in them, enclose the arguments in quotation marks. For example: “/some path/with spaces”

[options]

--compress-images, -i
Losslessly compress images in the book, to reduce the filesize, without affecting image quality.

--cover, -c
Path to a cover image. Changes the cover specified in the e-book. If no cover is present, or the cover is not properly identified, inserts a new cover.

--embed-fonts, -e
Embed all fonts that are referenced in the document and are not already embedded. This will scan your computer for the fonts, and if they are found, they will be embedded into the document. Please ensure that you have the proper license for embedding the fonts used in this document.

--help, -h
show this help message and exit

--jacket, -j
Insert a "book jacket" page at the start of the book that contains all the book metadata such as title, tags, authors, series, comments, etc. Any previous book jacket will be replaced.

--opf, -o
Path to an OPF file. The metadata in the book is updated from the OPF file.

--remove-jacket
Remove a previous inserted book jacket page.

--remove-unused-css, -u
Remove all unused CSS rules from stylesheets and <style> tags. Some books created from production templates can have a large number of extra CSS rules that don't match any actual content. These extra rules can slow down readers that need to parse them all.

--smarten-punctuation, -p
Convert plain text dashes, ellipsis, quotes, multiple hyphens, etc. into their typographically correct equivalents. Note that the algorithm can sometimes generate incorrect results, especially when single quotes at the start of contractions are involved.
--subset-fonts, -f
Subsetting fonts means reducing an embedded font to contain only the characters used from that font in the
book. This greatly reduces the size of the font files (halving the font file sizes is common). For example, if the
book uses a specific font for headers, then subsetting will reduce that font to contain only the characters present
in the actual headers in the book. Or if the book embeds the bold and italic versions of a font, but bold and
italic text is relatively rare, or absent altogether, then the bold and italic fonts can either be reduced to only a few
characters or completely removed. The only downside to subsetting fonts is that if, at a later date you decide to
add more text to your books, the newly added text might not be covered by the subset font.

--upgrade-book, -U
Upgrade the internal structures of the book, if possible. For instance, upgrades EPUB 2 books to EPUB 3 books.

--verbose
Produce more verbose output, useful for debugging.

--version
show program's version number and exit

12.1.11 ebook-viewer

ebook-viewer [options] file

View an e-book.

Whenever you pass arguments to ebook-viewer that have spaces in them, enclose the arguments in quotation
marks. For example: “/some path/with spaces”

[options]

--continue
Continue reading at the previously opened book

--debug-javascript
Print javascript alert and console messages to the console

--detach
Detach from the controlling terminal, if any (Linux only)

--full-screen, --fullscreen, -f
If specified, viewer window will try to open full screen when started.

--help, -h
show this help message and exit

--open-at
The position at which to open the specified book. The position is a location as displayed in the top left corner of
the viewer. Alternately, you can use the form toc:something and it will open at the location of the first Table of
Contents entry that contains the string "something".

--raise-window
If specified, viewer window will try to come to the front when started.

--version
show program's version number and exit
12.1.12 fetch-ebook-metadata

```
fetch-ebook-metadata [options]
```

Fetch book metadata from online sources. You must specify at least one of title, authors or ISBN.

Whenever you pass arguments to `fetch-ebook-metadata` that have spaces in them, enclose the arguments in quotation marks. For example: “/some path/with spaces”

[options]

```
--allowed-plugin, -p
    Specify the name of a metadata download plugin to use. By default, all metadata plugins will be used. Can be specified multiple times for multiple plugins. All plugin names: Google, Google Images, Amazon.com, Edelweiss, Open Library, Overdrive, Douban Books, OZON.ru, Big Book Search

--authors, -a
    Book author(s)

--cover, -c
    Specify a filename. The cover, if available, will be saved to it. Without this option, no cover will be downloaded.

--help, -h
    show this help message and exit

--identifier, -I
    Identifiers such as ASIN/goodreads id etc. Can be specified multiple times for multiple identifiers. For example: --identifier (page 317) asin:B0082BAJA0

--isbn, -i
    Book ISBN

--opf, -o
    Output the metadata in OPF format instead of human readable text.

--timeout, -d
    Timeout in seconds. Default is 30

--title, -t
    Book title

--verbose, -v
    Print the log to the console (stderr)

--version
    show program's version number and exit

12.1.13 lrf2lrs

```
lrf2lrs book.lrf
```

Convert an LRF file into an LRS (XML UTF-8 encoded) file

Whenever you pass arguments to `lrf2lrs` that have spaces in them, enclose the arguments in quotation marks. For example: “/some path/with spaces”
[options]

--dont-output-resources
Do not save embedded image and font files to disk

--help, -h
show this help message and exit

--output, -o
Output LRS file

--verbose
Be more verbose

--version
show program's version number and exit

12.1.14 lrfviewer

lrfviewer [options] book.lrf

Read the LRF e-book book.lrf

Whenever you pass arguments to lrfviewer that have spaces in them, enclose the arguments in quotation marks. For example: “/some path/with spaces”

[options]

--disable-hyphenation
Disable hyphenation. Should significantly speed up rendering.

--help, -h
show this help message and exit

--profile
Profile the LRF renderer

--verbose
Print more information about the rendering process

--version
show program's version number and exit

--visual-debug
Turn on visual aids to debugging the rendering engine

--white-background
By default the background is off white as I find this easier on the eyes. Use this option to make the background pure white.

12.1.15 lrs2lrf

lrs2lrf [options] file.lrs
Compile an LRS file into an LRF file.
Whenever you pass arguments to `lrs2lrf` that have spaces in them, enclose the arguments in quotation marks. For example: “/some path/with spaces”

**options**

---help, -h
show this help message and exit

---lrs
Convert LRS to LRS, useful for debugging.

---output, -o
Path to output file

---verbose
Verbose processing

---version
show program’s version number and exit

12.1.16 web2disk

```bash
web2disk URL
```

Where URL is for example `https://google.com`
Whenever you pass arguments to `web2disk` that have spaces in them, enclose the arguments in quotation marks. For example: “/some path/with spaces”

**options**

---base-dir, -d
Base directory into which URL is saved. Default is .

---delay
Minimum interval in seconds between consecutive fetches. Default is 0 s

---dont-download-stylesheets
Do not download CSS stylesheets.

---encoding
The character encoding for the websites you are trying to download. The default is to try and guess the encoding.

---filter-regexp
Any link that matches this regular expression will be ignored. This option can be specified multiple times, in which case as long as any regexp matches a link, it will be ignored. By default, no links are ignored. If both filter regexp and match regexp are specified, then filter regexp is applied first.

---help, -h
show this help message and exit

---match-regexp
Only links that match this regular expression will be followed. This option can be specified multiple times, in which case as long as a link matches any one regexp, it will be followed. By default all links are followed.
--max-files, -n
The maximum number of files to download. This only applies to files from <a href> tags. Default is 922372036854775807

--max-recursions, -r
Maximum number of levels to recurse i.e. depth of links to follow. Default 1

--timeout, -t
Timeout in seconds to wait for a response from the server. Default: 10.0 s

--verbose
Show detailed output information. Useful for debugging

--version
show program's version number and exit

12.2 Undocumented commands

- ebook-device
- markdown-calibre

You can see usage for undocumented commands by executing them without arguments in a terminal.
Setting up a calibre development environment

calibre is completely open source, licensed under the GNU GPL v3\textsuperscript{101}. This means that you are free to download and modify the program to your heart’s content. In this section, you will learn how to get a calibre development environment set up on the operating system of your choice. calibre is written primarily in Python\textsuperscript{102} with some C/C++ code for speed and system interfacing. Note that calibre is not compatible with Python 3 and requires at least Python 2.7.9.

\textsuperscript{102} https://www.python.org
13.1 Design philosophy

calibre has its roots in the Unix world, which means that its design is highly modular. The modules interact with each other via well defined interfaces. This makes adding new features and fixing bugs in calibre very easy, resulting in a frenetic pace of development. Because of its roots, calibre has a comprehensive command line interface for all its functions, documented in Command Line Interface (page ??).

The modular design of calibre is expressed via Plugins. There is a tutorial (page 229) on writing calibre plugins. For example, adding support for a new device to calibre typically involves writing less than a 100 lines of code in the form of a device driver plugin. You can browse the built-in drivers\(^1\). Similarly, adding support for new conversion formats involves writing input/output format plugins. Another example of the modular design is the recipe system (page 25) for fetching news. For more examples of plugins designed to add features to calibre, see the Index of plugins\(^2\).

13.1.1 Code layout

All the calibre python code is in the calibre package. This package contains the following main sub-packages

- devices - All the device drivers. Just look through some of the built-in drivers to get an idea for how they work.
  - For details, see: devices.interface which defines the interface supported by device drivers and devices.usbms which defines a generic driver that connects to a USBMS device. All USBMS based drivers in calibre inherit from it.

- e-books - All the e-book conversion/metadata code. A good starting point is calibre.ebooks.conversion.cli which is the module powering the ebook-convert command. The conversion process is controlled via conversion.plumber. The format independent code is all in ebooks.oeb and the format dependent code is in ebooks.format_name.
  - Metadata reading, writing, and downloading is all in ebooks.metadata
  - Conversion happens in a pipeline, for the structure of the pipeline, see Introduction (page 63). The pipeline consists of an input plugin, various transforms and an output plugin. The code that constructs and drives the pipeline is in plumber.py. The pipeline works on a representation of an e-book that is like an unzipped epub, with manifest, spine, toc, guide, html content, etc. The class that manages this representation is OEBBook in ebooks.oeb.base. The various transformations that are applied to the book during conversions live in oeb/transforms/*.py. And the input and output plugins live in conversion/plugins/*.py.
  - E-book editing happens using a different container object. It is documented in API documentation for the e-book editing tools (page 335).

- db - The database back-end. See API documentation for the database interface (page 329) for the interface to the calibre library.

- Content server: srv is the calibre Content server.

\(^1\) https://github.com/kovidgoyal/calibre/tree/master/src/calibre/devices

If you want to locate the entry points for all the various calibre executables, look at the entry_points structure in linux.py.105

If you need help understanding the code, post in the development forum and you will most likely get help from one of calibre’s many developers.

13.2 Getting the code

You can get the calibre source code in two ways, using a version control system or directly downloading a tarball. calibre uses Git, a distributed version control system. Git is available on all the platforms calibre supports. After installing Git, you can get the calibre source code with the command:

```
git clone git://github.com/kovidgoyal/calibre.git
```

On Windows you will need the complete path name, that will be something like C:\Program Files\Git\git.exe.

calibre is a very large project with a very long source control history, so the above can take a while (10 mins to an hour depending on your internet speed).

If you want to get the code faster, the source code for the latest release is always available as an archive. To update a branch to the latest code, use the command:

```
git pull --no-edit
```

You can also browse the code at GitHub.

13.2.1 Submitting your changes to be included

If you only plan to make a few small changes, you can make your changes and create a “merge directive” which you can then attach to a ticket in the calibre bug tracker. To do this, make your changes, then run:

```
git commit -am "Comment describing your changes"
git format-patch origin/master --stdout > my-changes
```

This will create a my-changes file in the current directory, simply attach that to a ticket on the calibre bug tracker. Note that this will include all the commits you have made. If you only want to send some commits, you have to change origin/master above. To send only the last commit, use:

```
git format-patch HEAD~1 --stdout > my-changes
```

To send the last n commits, replace 1 with n, for example, for the last 3 commits:

```
git format-patch HEAD-3 --stdout > my-changes
```

112 https://bugs.launchpad.net/calibre

13.2. Getting the code
Be careful to not include merges when using HEAD~n.

If you plan to do a lot of development on calibre, then the best method is to create a GitHub account. Below is a basic guide to setting up your own fork of calibre in a way that will allow you to submit pull requests for inclusion into the main calibre repository:

- Setup git on your machine as described in this article: Setup Git
- Setup ssh keys for authentication to GitHub, as described here: Generating SSH keys
- Go to https://github.com/kovidgoyal/calibre and click the Fork button.
- In a Terminal do:

```bash
  git clone git@github.com:<username>/calibre.git
  git remote add upstream https://github.com/kovidgoyal/calibre.git
```

Replace <username> above with your github username. That will get your fork checked out locally.

- You can make changes and commit them whenever you like. When you are ready to have your work merged, do a:

```bash
  git push
```

and go to https://github.com/<username>/calibre and click the Pull Request button to generate a pull request that can be merged.

- You can update your local copy with code from the main repo at any time by doing:

```bash
  git pull upstream
```

You should also keep an eye on the calibre development forum. Before making major changes, you should discuss them in the forum or contact Kovid directly (his email address is all over the source code).

### 13.3 Windows development environment

**Note:** You must also get the calibre source code separately as described above.

Install calibre normally, using the Windows installer. Then open a Command Prompt and change to the previously checked out calibre code directory. For example:

```bash
  cd C:\Users\kovid\work\calibre
```

calibre is the directory that contains the src and resources sub-directories.

The next step is to set the environment variable CALIBRE_DEVELOP_FROM to the absolute path of the src directory. So, following the example above, it would be C:\Users\kovid\work\calibre\src. Here is a short guide to setting environment variables on Windows.

---

113 https://github.com
114 https://help.github.com/articles/set-up-git
115 https://help.github.com/articles/generating-ssh-keys
117 https://docs.python.org/2/using/windows.html#excursus-setting-environment-variables
Once you have set the environment variable, open a new command prompt and check that it was correctly set by using the command:

```
echo %CALIBRE_DEVELOP_FROM%
```

Setting this environment variable means that calibre will now load all its Python code from the specified location.

That’s it! You are now ready to start hacking on the calibre code. For example, open the file `src\calibre\__init__.py` in your favorite editor and add the line:

```
print ("Hello, world!")
```

near the top of the file. Now run the command `calibredb`. The very first line of output should be `Hello, world!`.

You can also setup a calibre development environment inside the free Microsoft Visual Studio, if you like, following the instructions here\(^{118}\).

### 13.4 macOS development environment

**Note:** You must also get the calibre source code separately as described above.

Install calibre normally using the provided .dmg. Then open a Terminal and change to the previously checked out calibre code directory, for example:

```
cd /Users/kovid/work/calibre
```

calibre is the directory that contains the src and resources sub-directories. The calibre command line tools are found inside the calibre app bundle, in `/Applications/calibre.app/Contents/console.app/Contents/MacOS` you should add this directory to your PATH environment variable, if you want to run the command line tools easily.

The next step is to create a bash script that will set the environment variable `CALIBRE_DEVELOP_FROM` to the absolute path of the src directory when running calibre in debug mode.

Create a plain text file:

```bash
#!/bin/sh
export CALIBRE_DEVELOP_FROM="/Users/kovid/work/calibre/src"
calibre-debug -g
```

Save this file as `/usr/bin/calibre-develop`, then set its permissions so that it can be executed:

```
chmod +x /usr/bin/calibre-develop
```

Once you have done this, run:

```
calibre-develop
```

You should see some diagnostic information in the Terminal window as calibre starts up, and you should see an asterisk after the version number in the GUI window, indicating that you are running from source.

**13.5 Linux development environment**

**Note:** You must also get the calibre source code separately as described above.

calibre is primarily developed on Linux. You have two choices in setting up the development environment. You can install the calibre binary as normal and use that as a runtime environment to do your development. This approach is similar to that used in Windows and macOS. Alternatively, you can install calibre from source. Instructions for setting up a development environment from source are in the INSTALL file in the source tree. Here we will address using the binary as a runtime, which is the recommended method.

Install calibre using the binary installer. Then open a terminal and change to the previously checked out calibre code directory, for example:

```bash
cd /home/kovid/work/calibre
```

calibre is the directory that contains the src and resources sub-directories.

The next step is to set the environment variable `CALIBRE_DEVELOP_FROM` to the absolute path of the src directory. So, following the example above, it would be `/home/kovid/work/calibre/src`. How to set environment variables depends on your Linux distribution and what shell you are using.

Once you have set the environment variable, open a new terminal and check that it was correctly set by using the command:

```bash
echo $CALIBRE_DEVELOP_FROM
```

Setting this environment variable means that calibre will now load all its Python code from the specified location.

That’s it! You are now ready to start hacking on the calibre code. For example, open the file `src/calibre/__init__.py` in your favorite editor and add the line:

```python
print ("Hello, world!")
```

near the top of the file. Now run the command `calibredb`. The very first line of output should be `Hello, world!`.

**13.6 Having separate “normal” and “development” calibre installs on the same computer**

The calibre source tree is very stable and rarely breaks, but if you feel the need to run from source on a separate test library and run the released calibre version with your everyday library, you can achieve this easily using .bat files or shell scripts to launch calibre. The example below shows how to do this on Windows using .bat files (the instructions for other platforms are the same, just use a shell script instead of a .bat file)

To launch the release version of calibre with your everyday library:

```bash
calibre-normal.bat:
```

```bash
calibre.exe "--with-library=C:\path\to\everyday\library folder"
```

To launch the release version of calibre with your everyday library:

```bash
calibre-dev.bat:
```

```bash
set CALIBRE_DEVELOP_FROM=C:\path\to\calibre\checkout\src

calibre.exe "--with-library=C:\path\to\test\library folder"
```
13.7 Debugging tips

Python is a dynamically typed language with excellent facilities for introspection. Kovid wrote the core calibre code without once using a debugger. There are many strategies to debug calibre code:

13.7.1 Using print statements

This is Kovid’s favorite way to debug. Simply insert print statements at points of interest and run your program in the terminal. For example, you can start the GUI from the terminal as:

```
calibre-debug -g
```

Similarly, you can start the e-book-viewer as:

```
calibre-debug -w /path/to/file/to/be/viewed
```

The e-book-editor can be started as:

```
calibre-debug -t /path/to/be/edited
```

13.7.2 Using an interactive Python interpreter

You can insert the following two lines of code to start an interactive Python session at that point:

```
from calibre import ipython
ipython(locals())
```

When running from the command line, this will start an interactive Python interpreter with access to all locally defined variables (variables in the local scope). The interactive prompt even has TAB completion for object properties and you can use the various Python facilities for introspection, such as `dir()`, `type()`, `repr()`, etc.

13.7.3 Using the Python debugger as a remote debugger

You can use the built-in Python debugger (pdb) as a remote debugger from the command line. First, start the remote debugger at the point in the calibre code you are interested in, like this:

```
from calibre.rpdb import set_trace
set_trace()
```

Then run calibre, either as normal, or using one of the calibre-debug commands described in the previous section. Once the above point in the code is reached, calibre will freeze, waiting for the debugger to connect.

Now open a terminal or command prompt and use the following command to start the debugging session:

```
calibre-debug -c "from calibre.rpdb import cli; cli()"
```

You can read about how to use the Python debugger in the Python stdlib docs for the pdb module\(^{119}\).

\(^{119}\) https://docs.python.org/2/library/pdb.html#debugger-commands
Note: By default, the remote debugger will try to connect on port 4444. You can change it, by passing the port parameter to both the set_trace() and the cli() functions above, like this: `set_trace(port=1234)` and `cli(port=1234)`.

Note: The Python debugger cannot handle multiple threads, so you have to call set_trace once per thread, each time with a different port number.

### 13.7.4 Using the debugger in your favorite Python IDE

It is possible to use the built-in debugger in your favorite Python IDE, if it supports remote debugging. The first step is to add the calibre src checkout to the `PYTHONPATH` in your IDE. In other words, the directory you set as `CALIBRE DEVELOP FROM` above, must also be in the `PYTHONPATH` of your IDE.

Then place the IDE’s remote debugger module into the `src` subdirectory of the calibre source code checkout. Add whatever code is needed to launch the remote debugger to calibre at the point of interest, for example in the main function. Then run calibre as normal. Your IDE should now be able to connect to the remote debugger running inside calibre.

### 13.7.5 Executing arbitrary scripts in the calibre Python environment

The `calibre-debug` command provides a couple of handy switches to execute your own code, with access to the calibre modules:

```
calibre-debug -c "some Python code"
```

is great for testing a little snippet of code on the command line. It works in the same way as the `-c` switch to the Python interpreter:

```
calibre-debug myscript.py
```

can be used to execute your own Python script. It works in the same way as passing the script to the Python interpreter, except that the calibre environment is fully initialized, so you can use all the calibre code in your script. To use command line arguments with your script, use the form:

```
calibre-debug myscript.py -- --option1 arg1
```

The `--` causes all subsequent arguments to be passed to your script.

### 13.8 Using calibre in your projects

It is possible to directly use calibre functions/code in your Python project. Two ways exist to do this:

#### 13.8.1 Binary install of calibre

If you have a binary install of calibre, you can use the Python interpreter bundled with calibre, like this:

```
calibre-debug /path/to/your/python/script.py -- arguments to your script
```
13.8.2 Source install on Linux

In addition to using the above technique, if you do a source install on Linux, you can also directly import calibre, as follows:

```python
import init_calibre
import calibre
print calibre.__version__
```

It is essential that you import the init_calibre module before any other calibre modules/packages as it sets up the interpreter to run calibre code.

13.9 API documentation for various parts of calibre

13.9.1 API documentation for the database interface

This API is thread safe (it uses a multiple reader, single writer locking scheme). You can access this API like this:

```python
from calibre.library import db
db = db('Path to calibre library folder').new_api
```

If you are in a calibre plugin that is part of the main calibre GUI, you get access to it like this instead:

```python
db = self.gui.current_db.new_api
```

class calibre.db.cache.Cache(backend)

An in-memory cache of the metadata.db file from a calibre library. This class also serves as a threadsafe API for accessing the database. The in-memory cache is maintained in normal form for maximum performance.

SQLITE is simply used as a way to read and write from metadata.db robustly. All table reading/sorting/searching/caching logic is re-implemented. This was necessary for maximum performance and flexibility.

add_books(books, add_duplicates=True, apply_import_tags=True, preserve_uuid=False, run_hooks=True, dbapi=None)

Add the specified books to the library. Books should be an iterable of 2-tuples, each 2-tuple of the form (mi, format_map) where mi is a Metadata object and format_map is a dictionary of the form {fmt: path_or_stream}, for example: {'EPUB': '/path/to/file.epub'}.

Returns a pair of lists: ids, duplicates. ids contains the book ids for all newly created books in the database. duplicates contains the (mi, format_map) for all books that already exist in the database as per the simple duplicate detection heuristic used by has_book() (page 333).

add_custom_book_data(name, val_map, delete_first=False)

Add data for name where val_map is a map of book_ids to values. If delete_first is True, all previously stored data for name will be removed.

add_format(book_id, fmt, stream_or_path, replace=True, run_hooks=True, dbapi=None)

Add a format to the specified book. Return True if the format was added successfully.

Parameters

• replace – If True replace existing format, otherwise if the format already exists, return False.
- **run_hooks** – If True, file type plugins are run on the format before and after being added.

- **dbapi** – Internal use only.

**all_book_ids** (type=<type 'frozenset'>)

Frozen set of all known book ids.

**all_field_for**(field, book_ids, default_value=None)

Same as field_for, except that it operates on multiple books at once

**all_field_ids**(name)

Frozen set of ids for all values in the field name.

**all_field_names**(field)

Frozen set of all fields names (should only be used for many-one and many-many fields)

**author_data**(author_ids=None)

Return author data as a dictionary with keys: name, sort, link

If no authors with the specified ids are found an empty dictionary is returned. If author_ids is None, data for all authors is returned.

**author_sort_from_authors**(authors, key_func=<function lower>)

Given a list of authors, return the author_sort string for the authors, preferring the author sort associated with the author over the computed string.

**books_for_field**(name, item_id)

Return all the books associated with the item identified by item_id, where the item belongs to the field name.

Returned value is a set of book ids, or the empty set if the item or the field does not exist.

**books_in_virtual_library**(vl, search_restriction=None)

Return the set of books in the specified virtual library

**copy_cover_to**(book_id, dest, use_hardlink=False, report_file_size=None)

Copy the cover to the file like object dest. Returns False if no cover exists or dest is the same file as the current cover. dest can also be a path in which case the cover is copied to it if and only if the path is different from the current path (taking case sensitivity into account).

**copy_format_to**(book_id, fmt, dest, use_hardlink=False, report_file_size=None)

Copy the format fmt to the file like object dest. If the specified format does not exist, raises NoSuchFormat error. dest can also be a path (to a file), in which case the format is copied to it, iff the path is different from the current path (taking case sensitivity into account).

**cover**(book_id, as_file=False, as_image=False, as_path=False)

Return the cover image or None. By default, returns the cover as a bytestring.

WARNING: Using as_path will copy the cover to a temp file and return the path to the temp file. You should delete the temp file when you are done with it.

**Parameters**

- **as_file** – If True return the image as an open file object (a SpooledTemporaryFile)

- **as_image** – If True return the image as a QImage object

- **as_path** – If True return the image as a path pointing to a temporary file

**data_for_find_identical_books()**

Return data that can be used to implement find_identical_books() (page 331) in a worker process without access to the db. See db.utils for an implementation.
data_for_has_book()

Return data suitable for use in has_book() (page 333). This can be used for an implementation of has_book() (page 333) in a worker process without access to the db.

delete_custom_book_data(name, book_ids=())

Delete data for name. By default deletes all data, if you only want to delete data for some book ids, pass in a list of book ids.

embed_metadata(book_ids=None, only_fmts=None, report_error=None, report_progress=None)

Update metadata in all formats of the specified book_ids to current metadata in the database.

fast_field_for(field_obj, book_id, default_value=None)

Same as field_for, except that it avoids the extra lookup to get the field object.

field_for(name, book_id, default_value=None)

Return the value of the field name for the book identified by book_id. If no such book exists or it has no defined value for the field name or no such field exists, then default_value is returned.

default_value is not used for title, title_sort, authors, author_sort and series_index. This is because these always have values in the db. default_value is used for all custom columns.

The returned value for is_multiple fields are always tuples, even when no values are found (in other words, default_value is ignored). The exception is identifiers for which the returned value is always a dict. The returned tuples are always in link order, that is, the order in which they were created.

field_ids_for(name, book_id)

Return the ids (as a tuple) for the values that the field name has on the book identified by book_id. If there are no values, or no such book, or no such field, an empty tuple is returned.

find_identical_books(mi, search_restriction=u", book_ids=None)

Finds books that have a superset of the authors in mi and the same title (title is fuzzy matched). See also data_for_find_identical_books() (page 330).

format(book_id, fmt, as_file=False, as_path=False, preserve_filename=False)

Return the e-book format as a bytestring or None if the format doesn’t exist, or we don’t have permission to write to the e-book file.

Parameters

• as_file – If True the e-book format is returned as a file object. Note that the file object is a SpooledTemporaryFile, so if what you want to do is copy the format to another file, use copy_format_to() (page 330) instead for performance.

• as_path – Copies the format file to a temp file and returns the path to the temp file

• preserve_filename – If True and returning a path the filename is the same as that used in the library. Note that using this means that repeated calls yield the same temp file (which is re-created each time)

format_abspath(book_id, fmt)

Return absolute path to the e-book file of format format. You should almost never use this, as it breaks the thread safe promise of this API. Instead use, copy_format_to() (page 330).

Currently used only in calibredb list, the viewer, edit book, compare_format to original format, open with, bulk metadata edit and the catalogs (via get_data_as_dict()).

Apart from the viewer, open with and edit book, I don’t believe any of the others do any file write I/O with the results of this call.

format_hash(book_id, fmt)

Return the hash of the specified format for the specified book. The kind of hash is backend dependent, but is usually SHA-256.
format_metadata (book_id, fmt, allow_cache=True, update_db=False)
Return the path, size and mtime for the specified format for the specified book. You should not use path unless you absolutely have to, since accessing it directly breaks the threadsafe guarantees of this API. Instead use the copy_format_to() (page 330) method.

Parameters
- allow_cache – If True cached values are used, otherwise a slow filesystem access is done. The cache values could be out of date if access was performed to the filesystem outside of this API.
- update_db – If True The max_size field of the database is updated for this book.

formats (book_id, verify_formats=True)
Return tuple of all formats for the specified book. If verify_formats is True, verifies that the files exist on disk.

get_categories (sort=u'name', book_ids=None, already_fixed=None, first_letter_sort=False)
Used internally to implement the Tag Browser

get_custom_book_data (name, book_ids=(), default=None)
Get data for name. By default returns data for all book_ids, pass in a list of book ids if you only want some data. Returns a map of book_id to values. If a particular value could not be decoded, uses default for it.

get_id_map (field)
Return a mapping of id numbers to values for the specified field. The field must be a many-one or many-many field, otherwise a ValueError is raised.

get_ids_for_custom_book_data (name)
Return the set of book ids for which name has data.

get_item_id (field, item_name)
Return the item id for item_name (case-insensitive)

get_item_ids (field, item_names)
Return the item id for item_name (case-insensitive)

get_item_name (field, item_id)
Return the item name for the item specified by item_id in the specified field. See also get_id_map() (page 332).

get_metadata (book_id, get_cover=False, get_user_categories=True, cover_as_data=False)
Return metadata for the book identified by book_id as a calibre.ebooks.metadata.book.base.Metadata (page 185) object. Note that the list of formats is not verified. If get_cover is True, the cover is returned, either a path to temp file as mi.cover or if cover_as_data is True then as mi.cover_data.

get_next_series_num_for (series, field=u'series', current_indices=False)
Return the next series index for the specified series, taking into account the various preferences that control next series number generation.

Parameters
- field – The series-like field (defaults to the builtin series column)
- current_indices – If True, returns a mapping of book_id to current series_index value instead.

get_proxy_metadata (book_id)
Like get_metadata() (page 332) except that it returns a ProxyMetadata object that only reads values from the database on demand. This is much faster than get_metadata when only a small number of fields need to be accessed from the returned metadata object.
get_usage_count_by_id(field)
Return a mapping of id to usage count for all values of the specified field, which must be a many-one or many-many field.

has_book(mi)
Return True iff the database contains an entry with the same title as the passed in Metadata object. The comparison is case-insensitive. See also data_for_has_book() (page 330).

has_format(book_id, fmt)
Return True iff the format exists on disk

has_id(book_id)
Return True iff the specified book_id exists in the db

init()
Initialize this cache with data from the backend.

multisort(fields, ids_to_sort=None, virtual_fields=None)
Return a list of sorted book ids. If ids_to_sort is None, all book ids are returned.

fields must be a list of 2-tuples of the form (field_name, ascending=True or False). The most significant field is the first 2-tuple.

pref(name, default=None)
Return the value for the specified preference or the value specified as default if the preference is not set.

read_backup(book_id)
Return the OPF metadata backup for the book as a bytestring or None if no such backup exists.

remove_books(book_ids, permanent=False)
Remove the books specified by the book_ids from the database and delete their format files. If permanent is False, then the format files are placed in the recycle bin.

remove_formats(formats_map, db_only=False)
Remove the specified formats from the specified books.

Parameters
• formats_map – A mapping of book_id to a list of formats to be removed from the book.
• db_only – If True, only remove the record for the format from the db, do not delete the actual format file from the filesystem.

remove_items(field, item_ids, restrict_to_book_ids=None)
Delete all items in the specified field with the specified ids. Returns the set of affected book ids.

restrict_to_book_ids is an optional set of books ids. If specified the items will only be removed from those books.

rename_items(field, item_id_to_new_name_map, change_index=True, restrict_to_book_ids=None)
Rename items from a many-one or many-many field such as tags or series.

Parameters
• change_index – When renaming in a series-like field also change the series_index values.
• restrict_to_book_ids – An optional set of book ids for which the rename is to be performed, defaults to all books.

restore_book(book_id, mi, last_modified, path, formats)
Restore the book entry in the database for a book that already exists on the filesystem.
**restore_original_format** *(book_id, original_fmt)*

Restore the specified format from the previously saved ORIGINAL_FORMAT, if any. Return True on success. The ORIGINAL_FORMAT is deleted after a successful restore.

**safe_read_lock**

A safe read lock is a lock that does nothing if the thread already has a write lock, otherwise it acquires a read lock. This is necessary to prevent DowngradeLockErrors, which can happen when updating the search cache in the presence of composite columns. Updating the search cache holds an exclusive lock, but searching a composite column involves reading field values via ProxyMetadata which tries to get a shared lock. There may be other scenarios that trigger this as well.

This property returns a new lock object on every access. This lock object is not recursive (for performance) and must only be used in a with statement as `with cache.safe_read_lock:` otherwise bad things will happen.

**save_original_format** *(book_id, fmt)*

Save a copy of the specified format as ORIGINAL_FORMAT, overwriting any existing ORIGINAL_FORMAT.

**search** *(query, restriction=u", virtual_fields=None, book_ids=None)*

Search the database for the specified query, returning a set of matched book ids.

**set_conversion_options** *(options, fmt=u'PIPE')*

options must be a map of the form `{book_id:conversion_options}`

**set_cover** *(book_id_data_map)*

Set the cover for this book. data can be either a QImage, QPixmap, file object or bytestring. It can also be None, in which case any existing cover is removed.

**set_field** *(name, book_id_to_val_map, allow_case_change=True, do_path_update=True)*

Set the values of the field specified by `name`. Returns the set of all book ids that were affected by the change.

**set_metadata** *(book_id, mi, ignore_errors=False, force_changes=False, set_title=True, set_authors=True, allow_case_change=False)*

Set metadata for the book `id` from the `Metadata` object `mi`

Setting `force_changes=True` will force `set_metadata` to update fields even if `mi` contains empty values. In this case, ‘None’ is distinguished from ‘empty’. If `mi.XXX` is None, the XXX is not replaced, otherwise it is. The tags, identifiers, and cover attributes are special cases. Tags and identifiers cannot be set to None so they will always be replaced if `force_changes` is true. You must ensure that `mi` contains the values you
want the book to have. Covers are always changed if a new cover is provided, but are never deleted. Also note that force_changes has no effect on setting title or authors.

```
set_pref(name, val)
```
Set the specified preference to the specified value. See also `pref()` (page 333).

```
tags_older_than(tag, delta=None, must_have_tag=None, must_have_authors=None)
```
Return the ids of all books having the tag `tag` that are older than the specified time. `tag` comparison is case insensitive.

**Parameters**
- `delta` – A timedelta object or None. If None, then all ids with the tag are returned.
- `must_have_tag` – If not None the list of matches will be restricted to books that have this tag.
- `must_have_authors` – A list of authors. If not None the list of matches will be restricted to books that have these authors (case insensitive).

```
user_categories_for_books(book_ids, proxy_metadata_map=None)
```
Return the user categories for the specified books. `proxy_metadata_map` is optional and is useful for a performance boost, in contexts where a ProxyMetadata object for the books already exists. It should be a mapping of book_ids to their corresponding ProxyMetadata objects.

### 13.9.2 API documentation for the e-book editing tools

The e-book editing tools consist of a `calibre.ebooks.oeb.polish.container.Container` (page 335) object that represents a book as a collection of HTML + resource files, and various tools that can be used to perform operations on the container. All the tools are in the form of module level functions in the various `calibre.ebooks.oeb.polish.*` modules.

You obtain a container object for a book at a path like this:

```python
from calibre.ebooks.oeb.polish.container import get_container
container = get_container('Path to book file', tweak_mode=True)
```

If you are writing a plugin for the E-book editor, you get the current container for the book being edited like this:

```python
from calibre.gui2.tweak_book import current_container
container = current_container()
if container is None:
    report_error # No book has been opened yet
```

### The Container object

```
class calibre.ebooks.oeb.polish.container.Container(rootpath, opfpath, log, clone_data=None)
```
A container represents an Open E-Book as a directory full of files and an opf file. There are two important concepts:

- The root directory. This is the base of the e-book. All the e-books files are inside this directory or in its sub-directories.
- Names: These are paths to the books’ files relative to the root directory. They always contain POSIX separators and are unquoted. They can be thought of as canonical identifiers for files in the book. Most methods on the container object work with names. Names are always in the NFC unicode normal form.
• Clones: the container object supports efficient on-disk cloning, which is used to implement checkpoints in the e-book editor. In order to make this work, you should never access files on the filesystem directly. Instead, use `raw_data()` (page 338) or `open()` (page 337) to read/write to component files in the book.

When converting between hrefs and names use the methods provided by this class, they assume all hrefs are quoted.

```python
abspath_to_name(fullpath, root=None)
```
Convert an absolute path to a canonical name relative to `root`.

**Parameters**
- `root` -- The base directory. By default the root for this container object is used.

```python
add_file(name, data, media_type=None, spine_index=None, modify_name_if_needed=False, process_manifest_item=None)
```
Add a file to this container. Entries for the file are automatically created in the OPF manifest and spine (if the file is a text document).

```python
add_name_to_manifest(name, process_manifest_item=None)
```
Add an entry to the manifest for a file with the specified name. Returns the manifest id.

```python
add_properties(name, *properties)
```
Add the specified properties to the manifest item identified by name.

```python
apply_unique_properties(name, *properties)
```
Ensure that the specified properties are set on only the manifest item identified by name. You can pass None as the name to remove the property from all items.

```python
book_type = u'oeb'
```
The type of book (epub for EPUB files and azw3 for AZW3 files)

```python
commit(output=None, keep_parsed=False)
```
Commit all dirtied parsed objects to the filesystem and write out the e-book file at `output`.

**Parameters**
- `output` -- The path to write the saved e-book file to. If None, the path of the original book file is used.
- `keep_parsed` -- If True the parsed representations of committed items are kept in the cache.

```python
commit_item(name, keep_parsed=False)
```
Commit a parsed object to disk (it is serialized and written to the underlying file). If `keep_parsed` is True the parsed representation is retained in the cache. See also: `parsed()` (page 338)

```python
dirty(name)
```
Mark the parsed object corresponding to `name` as dirty. See also: `parsed()` (page 338).

```python
exists(name)
```
True iff a file/directory corresponding to the canonical name exists. Note that this function suffers from the limitations of the underlying OS filesystem, in particular case (in)sensitivity. So on a case insensitive filesystem this will return True even if the case of `name` is different from the case of the underlying filesystem file. See also `has_name()` (page 337)

```python
filesize(name)
```
Return the size in bytes of the file represented by the specified canonical name. Automatically handles dirtied parsed objects. See also: `parsed()` (page 338)

```python
generate_item(name, id_prefix=None, media_type=None, unique_href=True)
```
Add an item to the manifest with href derived from the given name. Ensures uniqueness of href and id automatically. Returns generated item.
get_file_path_for_processing(name, allow_modification=True)
 Similar to open() except that it returns a file path, instead of an open file object.

guide_type_map
 Mapping of guide type to canonical name

has_name(name)
 Return True iff a file with the same canonical name as that specified exists. Unlike exists() (page 336) this method is always case-sensitive.

href_to_name(href, base=None)
 Convert an href (relative to base) to a name. base must be a name or None, in which case self.root is used.

insert_into_xml(parent, item, index=None)
 Insert item into parent (or append if index is None), fixing indentation. Only works with self closing items.

is_dir = False
 If this container represents an unzipped book (a directory)

iterlinks(name, get_line_numbers=True)
 Iterate over all links in name. If get_line_numbers is True the yields results of the form (link, line_number, offset). Where line_number is the line_number at which the link occurs and offset is the number of characters from the start of the line. Note that offset could actually encompass several lines if not zero.

make_name_unique(name)
 Ensure that name does not already exist in this book. If it does, return a modified version that does not exist.

manifest_has_name(name)
 Return True if the manifest has an entry corresponding to name

manifest_id_map
 Mapping of manifest id to canonical names

manifest_items_of_type(predicate)
 The names of all manifest items whose media-type matches predicate. predicate can be a set, a list, a string or a function taking a single argument, which will be called with the media-type.

manifest_items_with_property(property_name)
 All manifest items that have the specified property

manifest_type_map
 Mapping of manifest media-type to list of canonical names of that media-type

mi
 The metadata of this book as a Metadata object. Note that this object is constructed on the fly every time this property is requested, so use it sparingly.

name_to_abspath(name)
 Convert a canonical name to an absolute OS dependant path

name_to_href(name, base=None)
 Convert a name to a href relative to base, which must be a name or None in which case self.root is used as the base

names_that_must_not_be_changed
 Set of names that must never be renamed. Depends on the e-book file format.

names_that_must_not_be_removed
 Set of names that must never be deleted from the container. Depends on the e-book file format.

names_that_need_not_beManifested
 Set of names that are allowed to be missing from the manifest. Depends on the e-book file format.
open(name, mode=u’rb’)
Open the file pointed to by name for direct read/write. Note that this will commit the file if it is dirtied and remove it from the parse cache. You must finish with this file before accessing the parsed version of it again, or bad things will happen.

opf
The parsed OPF file

opf_get_or_create(name)
Convenience method to either return the first XML element with the specified name or create it under the opf:package element and then return it, if it does not already exist.

opf_version
The version set on the OPF’s <package> element

opf_version_parsed
The version set on the OPF’s <package> element as a tuple of integers

opf_xpath(expr)
Convenience method to evaluate an XPath expression on the OPF file, has the opf: and dc: namespace prefixes pre-defined.

parsed(name)
Return a parsed representation of the file specified by name. For HTML and XML files an lxml tree is returned. For CSS files a cssutils stylesheet is returned. Note that parsed objects are cached for performance. If you make any changes to the parsed object, you must call dirty() (page 336) so that the container knows to update the cache. See also replace() (page 338).

raw_data(name, decode=True, normalize_to_nfc=True)
Return the raw data corresponding to the file specified by name

Parameters

• decode – If True and the file has a text based mimetype, decode it and return a unicode object instead of raw bytes.

• normalize_to_nfc – If True the returned unicode object is normalized to the NFC normal form as is required for the EPUB and AZW3 file formats.

relpath(path, base=None)
Convert an absolute path (with os separators) to a path relative to base (defaults to self.root). The relative path is not a name. Use abspath_to_name() (page 336) for that.

remove_from_spine(spine_items, remove_if_no_longer_in_spine=True)
Remove the specified items (by canonical name) from the spine. If remove_if_no_longer_in_spine is True, the items are also deleted from the book, not just from the spine.

remove_from_xml(item)
Removes item from parent, fixing indentation (works only with self closing items)

remove_item(name, remove_from_guide=True)
Remove the item identified by name from this container. This removes all references to the item in the OPF manifest, guide and spine as well as from any internal caches.

rename(current_name, new_name)
Renames a file from current_name to new_name. It automatically rebases all links inside the file if the directory the file is in changes. Note however, that links are not updated in the other files that could reference this file. This is for performance, such updates should be done once, in bulk.
replace \((name, obj)\)
Replace the parsed object corresponding to name with obj, which must be a similar object, i.e. an lxml tree for HTML/XML or a cssutils stylesheet for a CSS file.

replace_links \((name, replace\_func)\)
Replace all links in name using replace\_func, which must be a callable that accepts a URL and returns the replaced URL. It must also have a ‘replaced’ attribute that is set to True if any actual replacement is done. Convenient ways of creating such callables are using the LinkReplacer and LinkRebaser classes.

serialize_item \((name)\)
Convert a parsed object (identified by canonical name) into a bytestring. See parsed() (page 338).

set_spine \((spine\_items)\)
Set the spine to be spine\_items where spine\_items is an iterable of the form (name, linear). Will raise an error if one of the names is not present in the manifest.

spine\_items
An iterator yielding the path for every item in the books’ spine. See also: spine\_iter (page 339) and spine\_items (page 339).

spine\_iter
An iterator that yields item, name is_linear for every item in the books’ spine. item is the lxml element, name is the canonical file name and is_linear is True if the item is linear. See also: spine\_names (page 339) and spine\_items (page 339).

spine\_names
An iterator yielding name and is_linear for every item in the books’ spine. See also: spine\_iter (page 339) and spine\_items (page 339).

Managing component files in a container

calibre.ebooks.oeb.polish.replace.replace\_links \((container, link\_map, \text{frag\_map}=<\text{function } \lambda\text{, }\text{name, anchor}<\text{, }\text{replace\_in\_opf}=\text{False}>,\text{replace\_in\_opf}=\text{False})\)
Replace links to files in the container. Will iterate over all files in the container and change the specified links in them.

Parameters

- link\_map – A mapping of old canonical name to new canonical name. For example:
  
  ```
  {'images/old.png': 'images/new.png'}
  ```

- frag\_map – A callable that takes two arguments \((name, anchor)\) and returns a new anchor. This is useful if you need to change the anchors in HTML files. By default, it does nothing.

- replace\_in\_opf – If False, links are not replaced in the OPF file.

calibre.ebooks.oeb.polish.replace.rename\_files \((container, file\_map)\)
Rename files in the container, automatically updating all links to them.

Parameters file\_map – A mapping of old canonical name to new canonical name, for example:

```
{'text/chapter1.html': 'chapter1.html'}.
```

calibre.ebooks.oeb.polish.replace.get\_recommended\_folders \((container, names)\)
Return the folders that are recommended for the given filenames. The recommendation is based on where the majority of files of the same type are located in the container. If no files of a particular type are present, the recommended folder is assumed to be the folder containing the OPF file.
Pretty printing and auto fixing parse errors

calibre.ebooks.oeb.polish.pretty.fix_html(container, raw)
    Fix any parsing errors in the HTML represented as a string in raw. Fixing is done using the HTML5 parsing algorithm.

calibre.ebooks.oeb.polish.pretty.fix_all_html(container)
    Fix any parsing errors in all HTML files in the container. Fixing is done using the HTML5 parsing algorithm.

calibre.ebooks.oeb.polish.pretty.pretty_html(container, name, raw)
    Pretty print the HTML represented as a string in raw

calibre.ebooks.oeb.polish.pretty.pretty_css(container, name, raw)
    Pretty print the CSS represented as a string in raw

calibre.ebooks.oeb.polish.pretty.pretty_xml(container, name, raw)
    Pretty print the XML represented as a string in raw. If name is the name of the OPF, extra OPF-specific prettying is performed.

calibre.ebooks.oeb.polish.pretty.pretty_all(container)
    Pretty print all HTML/CSS/XML files in the container

Managing book jackets

calibre.ebooks.oeb.polish.jacket.remove_jacket(container)
    Remove an existing jacket, if any. Returns False if no existing jacket was found.

calibre.ebooks.oeb.polish.jacket.add_or_replace_jacket(container)
    Either create a new jacket from the book’s metadata or replace an existing jacket. Returns True if an existing jacket was replaced.

Splitting and merging of files

calibre.ebooks.oeb.polish.split.split(container, name, loc_or_xpath, before=True, totals=None)
    Split the file specified by name at the position specified by loc_or_xpath. Splitting automatically migrates all links and references to the affected files.

    Parameters
    • loc_or_xpath – Should be an XPath expression such as //h:div[@id="split_here"]. Can also be a loc which is used internally to implement splitting in the preview panel.
    • before – If True the split occurs before the identified element otherwise after it.
    • totals – Used internally

calibre.ebooks.oeb.polish.split.multisplit(container, name, xpath, before=True)
    Split the specified file at multiple locations (all tags that match the specified XPath expression). See also: split() (page 340). Splitting automatically migrates all links and references to the affected files.

    Parameters before – If True the splits occur before the identified element otherwise after it.

calibre.ebooks.oeb.polish.split.merge(container, category, names, master)
    Merge the specified files into a single file, automatically migrating all links and references to the affected files. The file must all either be HTML or CSS files.

    Parameters
    • category – Must be either 'text' for HTML files or 'styles' for CSS files
• **names** – The list of files to be merged

• **master** – Which of the merged files is the *master* file, that is, the file that will remain after merging.

### Managing covers

**calibre.ebooks.oeb.polish.cover.set_cover** *(container, cover_path, report=None, options=None)*

Set the cover of the book to the image pointed to by `cover_path`.

**Parameters**

• **cover_path** – Either the absolute path to an image file or the canonical name of an image in the book. When using an image in the book, you must also set `options`, see below.

• **report** – An optional callable that takes a single argument. It will be called with information about the tasks being processed.

• **options** – None or a dictionary that controls how the cover is set. The dictionary can have entries: `keep_aspect`: True or False (Preserve aspect ratio of covers in EPUB) **no_svg**; True or False (Use an SVG cover wrapper in the EPUB titlepage) `existing`: True or False (`cover_path` refers to an existing image in the book)

**calibre.ebooks.oeb.polish.cover.mark_as_cover** *(container, name)*

Mark the specified image as the cover image.

**calibre.ebooks.oeb.polish.cover.mark_as_titlepage** *(container, name, move_to_start=True)*

Mark the specified HTML file as the titlepage of the EPUB.

**Parameters**

• **move_to_start** – If True the HTML file is moved to the start of the spine

### Working with CSS

**calibre.ebooks.oeb.polish.fonts.change_font** *(container, old_name, new_name=None)*

Change a font family from `old_name` to `new_name`. Changes all occurrences of the font family in stylesheets, style tags and style attributes. If the `old_name` refers to an embedded font, it is removed. You can set `new_name` to None to remove the font family instead of changing it.

**calibre.ebooks.oeb.polish.css.remove_unused_css** *(container, report=None, remove_unused_classes=False, merge_rules=False)*

Remove all unused CSS rules from the book. An unused CSS rule is one that does not match any actual content.

**Parameters**

• **report** – An optional callable that takes a single argument. It is called with information about the operations being performed.

• **remove_unused_classes** – If True, class attributes in the HTML that do not match any CSS rules are also removed.

• **merge_rules** – If True, rules with identical selectors are merged.

**calibre.ebooks.oeb.polish.css.filter_css** *(container, properties, names=())*

Remove the specified CSS properties from all CSS rules in the book.

**Parameters**
• **properties** – Set of properties to remove. For example: `{'font-family', 'color'}`.

• **names** – The files from which to remove the properties. Defaults to all HTML and CSS files in the book.

## Working with the Table of Contents

`calibre.ebooks.oeb.polish.toc.from_xpaths(container, xpaths)`
Generate a Table of Contents from a list of XPath expressions. Each expression in the list corresponds to a level of the generate ToC. For example: `['//h:h1', '//h:h2', '//h:h3']` will generate a three level Table of Contents from the `<h1>`, `<h2>` and `<h3>` tags.

`calibre.ebooks.oeb.polish.toc.from_links(container)`
Generate a Table of Contents from links in the book.

`calibre.ebooks.oeb.polish.toc.from_files(container)`
Generate a Table of Contents from files in the book.

`calibre.ebooks.oeb.polish.toc.create_inline_toc(container, title=None)`
Create an inline (HTML) Table of Contents from an existing NCX Table of Contents.

**Parameters**
- **title** – The title for this table of contents.

## Edit book tool

`class calibre.gui2.tweak_book.plugin.Tool`

The base class for individual tools in an Edit Book plugin. Useful members include:

- **self.plugin**: A reference to the `calibre.customize.Plugin` object to which this tool belongs.
- **self.boss** (page 342)
- **self.gui** (page 342)

Methods that must be overridden in sub classes:

- **create_action()** (page 343)
- **register_shortcut()** (page 343)

**name** = `None`
Set this to a unique name it will be used as a key

**allowed_in_toolbar** = `True`
If True the user can choose to place this tool in the plugins toolbar

**allowed_in_menu** = `True`
If True the user can choose to place this tool in the plugins menu

**toolbar_button_popup_mode** = `u'delayed'`
The popup mode for the menu (if any) of the toolbar button. Possible values are ‘delayed’, ‘instant’, ‘button’

**boss**
The `calibre.gui2.tweak_book.boss.Boss` object. Used to control the user interface.
The main window of the user interface

Return the current `calibre.ebooks.oeb.polish.container.Container` object that represents the book being edited.

Register a keyboard shortcut that will trigger the specified `qaction`. This keyboard shortcut will become automatically customizable by the user in the Keyboard section of the editor preferences.

Parameters

- `qaction` – A QAction object, it will be triggered when the configured key combination is pressed by the user.
- `unique_name` – A unique name for this shortcut/action. It will be used internally, it must not be shared by any other actions in this plugin.
- `default_keys` – A list of the default keyboard shortcuts. If not specified no default shortcuts will be set. If the shortcuts specified here conflict with either builtin shortcuts or shortcuts from user configuration/other plugins, they will be ignored. In that case, users will have to configure the shortcuts manually via Preferences. For example: `default_keys=('Ctrl+J', 'F9')`.
- `short_text` – An optional short description of this action. If not specified the text from the QAction will be used.
- `description` – An optional longer description of this action, it will be used in the preferences entry for this shortcut.

Create a QAction that will be added to either the plugins toolbar or the plugins menu depending on `for_toolbar`. For example:

```python
def create_action(self, for_toolbar=True):
    ac = QAction(get_icons('myicon.png'), 'Do something')
    if for_toolbar:
        # We want the toolbar button to have a popup menu
        menu = QMenu()
        ac.setMenu(menu)
        menu.addAction('Do something else')
        subaction = menu.addAction('And another')

        # Register a keyboard shortcut for this toolbar action be
        # careful to do this for only one of the toolbar action or
        # the menu action, not both.
        self.register_shortcut(ac, 'some-unique-name', default_keys=('Ctrl+K',
                                                                   '→'))
    return ac
```

See also:

Method `register_shortcut()` (page 343).

Controlling the editor’s user interface

The e-book editor’s user interface is controlled by a single global `Boss` object. This has many useful methods that can be used in plugin code to perform common tasks.
class calibre.gui2.tweak_book.boss.Boss(parent, notify=None)

add_savepoint(msg)
Create a restore checkpoint with the name specified as msg

apply_container_update_to_gui(mark_as_modified=True)
Update all the components of the user interface to reflect the latest data in the current book container.

Parameters mark_as_modified – If True, the book will be marked as modified, so the user will be prompted to save it when quitting.

close_editor(name)
Close the editor that is editing the file specified by name

commit_all_editors_to_container()
Commit any changes that the user has made to files open in editors to the container. You should call this method before performing any actions on the current container

currently_editing
Return the name of the file being edited currently or None if no file is being edited

edit_file(name, syntax=None, use_template=None)
Open the file specified by name in an editor

Parameters
• syntax – The media type of the file, for example, 'text/html'. If not specified it is guessed from the file extension.
• use_template – A template to initialize the opened editor with

open_book(path=None, edit_file=None, clear_notify_data=True, open_folder=False)
Open the e-book at path for editing. Will show an error if the e-book is not in a supported format or the current book has unsaved changes.

Parameters edit_file – The name of a file inside the newly opened book to start editing. Can also be a list of names.

rewind_savepoint()
Undo the previous creation of a restore checkpoint, useful if you create a checkpoint, then abort the operation with no changes

save_book()
Save the book. Saving is performed in the background

set_modified()
Mark the book as having been modified

show_current_diff(allow_revert=True, to_container=None)
Show the changes to the book from its last checkpointed state

Parameters
• allow_revert – If True the diff dialog will have a button to allow the user to revert all changes
• to_container – A container object to compare the current container to. If None, the previously checkpointed container is used

show_editor(name)
Show the editor that is editing the file specified by name
sync_preview_to_editor()

Sync the position of the preview panel to the current cursor position in the current editor
RSS  **RSS** (*Really Simple Syndication*) is a web feed format that is used to publish frequently updated content, like news articles, blog posts, etc. It is a format that is particularly suited to being read by computers, and is therefore the preferred way of getting content from the web into an e-book. There are many other feed formats in use on the Internet, and calibre understands most of them. In particular, it has good support for the **ATOM** format, which is commonly used for blogs.

**recipe**  A recipe is a set of instructions that teach calibre how to convert an online news source, such as a magazine or a blog, into an e-book. A recipe is essentially Python\(^{120}\) code. As such, it is capable of converting arbitrarily complex news sources into e-books. At the simplest level, it is just a set of variables, such as URLs, that give calibre enough information to go out onto the Internet and download the news.

**HTML**  **HTML** (*Hyper Text Mark-Up Language*), a subset of Standard Generalized Mark-Up Language (SGML) for electronic publishing, is the specific standard used for the World Wide Web.

**CSS**  **CSS** (*Cascading Style Sheets*) is a language used to describe how an **HTML** document should be rendered (visual styling).

**API**  (**Application Programming Interface**) is a source code interface that a library provides to support requests for services to be made of it by computer programs.

**LRF**  **LRF** The e-book format that is read by the SONY e-book readers.

**URL**  **URL** (*Uniform Resource Locator*) for example: http://example.com

**regexp**  **Regular expressions** provide a concise and flexible means for identifying strings of text of interest, such as particular characters, words, or patterns of characters. See regexp syntax\(^{121}\) for the syntax of regular expressions used in Python.
